The Ultimate 3.5 Drive

Introducing the new AE 3.5 Drive — setting a new standard for basic Apple II storage. All the reliability and performance of Apple's 3.5 drive at a price approaching that of the cheapest import. Our design incorporates the same top-quality Sony mechanism that Apple uses, but instead of Apple's \$429, our drive is \$279.

Just to make your decision easier, we added a couple of performance features like upgradeability to 1.4 MEG of capacity or higher — an upgrade we'll make available in the future.

High density capacity means you can stop playing diskette roulette. Simply store your large 2-disk application programs on one high-density disk and forget about fumbling for clumsy "sets" of disks. And storing files just became twice as easy too, because you'll only need half the previous number of disks.

Our exclusive 2-way LED indicator shows green for reading, red for writing. Now you can monitor the drive's progress and know that a disk is actually being copied, instead of being confronted with an ambiguous "on" light.

We're even making available a low-cost optional controller card for the IIe. The card

(not required for IIGS), allows the IIe to accept data from the 3.5 format. The AE drive is also Macintosh compatible and you will be able to separately upgrade to 1.44 MEG in the Macintosh format.

Aesthetically, the AE Drive is every bit as handsome as the Apple Drive. We designed a thick, high-impact plastic case to stack with and exactly match the footprint of Apple's drive. Naturally, the AE Drive is Conserver compatible, snuggling neatly inside the drive port.

We also added features like auto eject, complete daisy-chain capacity (from AE to another drive or vice versa) and a full one-year warranty.

Features

- 800K, upgradeable to 1.4 MEG or higher
- 2-way LED indicator, green for read, red for write
- Auto eject
- Daisy chain port — works both ways, connect a drive to it, or connect it to another drive
- 1 year warranty
- Apple compatible, works with IIe, IIc Plus, IIGS, Mac and PC Transporter

- Stack and footprint compatible with Apple Drive
- Conserver compatible
- FDHD compatible (upgrade to 1.4 MEG or higher on Apple II)
- FDHD SuperDrive compatible (upgrade to 1.44 MEG on Macintosh)

AE 3.5 Drive \$279

OLD DOS, OLD TRICKS?

► I just got a copy of the April 1990 *Nibble*, and felt compelled to write.

I have been an Apple II owner, user and enthusiast since 1982, and have owned and used II Plus, IIe, and IIGS systems both at home and at work. From the beginning, I, like many others, craved good information and publications, and *Nibble* was my overall favorite. Recently, however, there seems to be less and less relevant information in your magazine.

For example, in this issue, two of the feature articles (RAM Disk 3.3 and ProDOS Linker) relate all the way back to DOS 3.3. Please don't misunderstand — I am not condemning references to DOS 3.3 or the publication of articles relating to it. I am saying that this is certainly not anywhere near state-of-the-art, nor are the other articles in this issue.

For the past few years, there have been numerous "doom & gloom" stories circulating about the inevitable death of the Apple II line. I, for one, still believe the machine has a lot to offer. If, however, the publishers of magazines such as yours cannot promote its current (and future) capabilities, its death will most certainly be inevitable. A II Plus running DOS 3.3 simply cannot stand up to the newer

MS-DOS and Macintosh systems with megabytes of memory, windowed environments, faster processors, and so on.

The IIGS has incredible possibilities. With the addition of memory and accelerators, these grow further. There are currently rumors of a 20MHz 65816 CPU being considered. These are the hopes of all real II users. Applied Engineering's PC Transporter allows running MS-DOS on an Apple: this should not be considered as taking a step away from the II, but rather recognition of the fact that the world is demanding more ability to exchange information with other systems, and have more compatibility with them. My dream machine would be an enhanced IIGS running at 20 MHz, with lots of memory and a 386-based Transporter. I'd love to see Unix or some other multiprocessing operating system running on the 65816. Without the dreams to spark interest and development such a machine will never exist. In the old days, Apple II users felt nothing was impossible.

I feel it is the responsibility of publications such as yours to seek out and promote such ideas, spark new interests, and encourage development. Face it, DOS 3.3, like the 128K Macintosh, floppy-based MS-DOS, and radios using vacuum tubes, is history. If the Apple II does survive, it will be through growth — not by clinging to past memories, no matter how fond of them we may be.

James A. Westlake
San Jose, CA

DOS 3.3 may be "history" in some books, but it is still a simple, reliable operating system. As you may know from reading past Viewpoint columns, the entire Nibble accounting and order entry system runs under DOS 3.3 on a Corvus hard disk network.

Homework isn't just kids' stuff anymore.

PC Transporter gives the term homework a whole new meaning. Bring your MS-DOS work home from the office and use your Apple to get caught up. . . or get ahead. Now for a fraction of the cost of an IBM clone, your Apple II has the power to run virtually all MS-DOS programs.

And your Apple IIGS, IIe or II+ will run those programs at more than *three times the speed* of an IBM XT. Run Lotus 123, dBASE III PLUS, Harvard Graphics, Symphony, Microsoft Works, Flight Simulator and thousands of other titles you can't get for your Apple II!

Works with your Apple's peripherals

PC Transporter was designed to take full advantage of the Apple-compatible peripherals you already own. So you won't need an extra printer, monitor, mouse, modem or hard disk. They can all be used for *either* MS-DOS or ProDOS. And you can switch back and forth instantly, even transfer files from ProDOS to MS-DOS and back again.

Your Apple-compatible peripherals and PC Transporter not only work together, you get *faster operation and better quality graphics*,

since your Apple analog monitor is sharper than IBM-standard digital monitors.

Universal disk drive controller

PC Transporter works as a universal disk drive controller, enabling your Apple or AE 3.5 Drive to run MS-DOS or ProDOS and to shift instantly between the two. If you need 5.25 MS-DOS capability, our optional 5.25 IBM-format drives enable you to access 5.25 MS-DOS disks and will also store ProDOS.

Shop ALL the software aisles

Discover thousands of new titles you couldn't run at home before. Exchange ProDOS and MS-DOS files with your friends and co-workers. Store IBM programs on any ProDOS storage device including the Apple or AE 3.5 drive, Apple UniDisk 3.5, Apple or AE 5.25 Drive, Vulcan, SCSI or ProDOS compatible hard drives.

Easy to install and use

PC Transporter was designed by the experts so you don't have to be one to use it. We include clear, understandable installation instructions, pre-boot software and even an installation video to help.

The do-everything computer

Turn your Apple into a fast, powerful tool that'll change the way you think about home-

work. And know that Applied Engineering stands behind PC Transporter with a full one-year warranty and American-made pride.

The Apple II: Stay Tuned . . .

After more than two years of virtual invisibility, the Apple II is coming into sharper focus. This has been stimulated by:

- Wall Street, which hammered Apple Computer's stock earlier in the year for the company's neglect of the low-end personal computer market.
- Numerous letter-writing campaigns by you — concerned Apple II owners who have felt ignored, alienated, and orphaned.
- Sharply declining sales of the Apple II.

The convergence of these market forces set the stage for a series of open and candid communications between Apple Computer and the developer community. Late last year, I joined the board of the newly formed Apple II Developers Association to participate in those meetings with Apple. The other members of the ADA board are:

- Barney Stone, president of Stone Edge Software
- Roger Wagner, president of Roger Wagner Publishing
- Bob Hardman, vice-president of Applied Engineering
- Tom Weishaar, president of A2-Central
- Mark Simonsen, vice-president of Beagle Bros
- Paul Boule, publisher of *InCider*.

The members of the group have one important thing in common: We all make our living in the Apple II market. Over the months, a number of position papers, informal communications, and direct meetings with Apple have sharpened the issues and strategies that are important to the future of Apple Computer and the Apple II.

SOME REALITIES

Apple Computer clearly understands that Apple II owners feel frustrated and neglected. Apple also understands that both developers and consumers have made a massive investment in software for the Apple II. And Apple realizes that it is simply not good business to develop a reputation for orphaning a major customer constituency.

At the same time, Apple has an obvious dilemma. The bulk of new software and applications are being developed for the Macintosh. Furthermore, *if* Apple can develop and introduce a low-cost color Macintosh on a timely schedule, there are undoubtedly large economies of scale in adapting the Macintosh engine

to serve the low-end market. In everything from production, to parts, to training, to promotion, a single engine is the conceptual ideal.

Unfortunately, we live in a less-than-ideal world.

IBM, Tandy, and the clone manufacturers are attacking Apple's traditional markets with a vengeance. IBM upped the ante in January with a stated intention of bundling the Trackstar 128e card with its PS/2 to provide Apple II compatibility in the education market.

STRATEGIC DILEMMAS

The Apple II's performance has been steadily increasing, largely through the efforts of third-party developers. Applied Engineering's TransWarp III and Zip Technology's Zip Chip boost the Apple II processing performance up to eight times. Apple's most recent announcement is a high-speed SCSI card that improves disk access performance by up to 10 times. It comes with drivers for standard hard disks and Apple's CD-ROM drive; Apple is creating drivers for other SCSI devices, like scanners and tape drives.

Apple II performance improvements haven't been limited to hardware. Roger Wagner's HyperStudio has made significant inroads into the education market. More important, it has proved that hypermedia and the Macintosh user interface can be effectively implemented on an Apple IIGS. And if HyperCard for the Apple IIGS becomes a reality, it could spark a revitalized market interest in the IIGS.

A low-cost Mac faces the difficult challenge of providing a cost-effective alternative to *a system that already exists and gets the job done — the Apple II.*

GETTING THE ACT TOGETHER

In late March, Michael Spindler, Apple's new president, acknowledged in his first major speech that "we have to really get our act together and figure out what we're going to do with the Apple II." Apple Computer is realistically keeping its options open while it tries to mend fences with its Apple II customer base. Here are some realities:

- Two champions of the Apple II have been named within Apple Computer: Jane Lee, Manager of Apple II Product Marketing, and Nancy Stark, Manager of Apple II and Peripheral Marketing.
- Apple *knows* that its reputation in the Apple II market has become tarnished and that Apple II

continued on page 7

WELCOME TO NEW READERS

Welcome to *Nibble* magazine, one of the most interesting and useful publications available for Apple owners. *Nibble* publishes an outstanding collection of valuable Applesoft BASIC and other applications that you can type and run right from the magazine. And every application is supported with an article that shows you, step-by-step, how to put the project into your Apple II and how it works — even if you know nothing about programming!

If you're new to computing, however, you may find the world of programs a bit confusing at first. If this is the case, perhaps the best advice would be to spend some time with the manuals that came with your computer. Once you understand how to get Applesoft BASIC up and running, you'll be surprised at how easy it is to enter programs into your Apple. It's always a good idea to start small, with a short BASIC program. Don't forget to review the Typing Tips in this issue as well.

THE BASICS...

Applesoft BASIC is built right into your Apple II. You can type in and run BASIC programs without using your disk drives at all, but if you want to save your programs for later use, you'll need to follow the instructions in your owner's manuals to get BASIC and the disk operating system up and running.

Once you do, you will most likely see a "J" character, called a *prompt*. When you see the prompt, your computer is waiting for you to tell it what to do next. You can:

- Type commands from the disk operating system (e.g., CATALOG)
- Type commands in BASIC (e.g., PRINT 36*42)
- Type in a BASIC program line (e.g., 10 INPUT NAME\$,ADRS\$)

All BASIC programs consist of a sequence of numbered program lines. The program lines consist of a line number followed by one or more BASIC statements separated by colons. For example,

```
20 FOR I = 1 TO 5: PRINT CHR$(7):  
NEXT I
```

To enter a program, start with the first numbered program line and type it in — including the line number itself — exactly as it appears in the listing. Though a program line may span several printed lines in the listing, do not press Return (the Return key) until you have typed the entire program line. Repeat the process with the next program line, and continue until you have entered them all.

To enter the program in Listing 1, follow this sequence:

1. Make sure the Caps Lock key is down.
2. Type NEW and press Return to erase any program lines that may already be in memory.

3. Type line 10 exactly as it appears, pressing Return after typing the last word in the line ("BELL").
4. Repeat this process for lines 20-30
5. Type SAVE RINGER and press Return to save the program on disk under the name RINGER.
6. Type RUN and press Return to start the program. If you entered each line correctly, you should hear a bell ring five times.

LISTING 1

```
10 REM RING THE BELL  
20 FOR I = 1 TO 5: PRINT  
CHR$(7): NEXT I  
30 END
```

...AND BEYOND

In addition to BASIC, *Nibble* also publishes programs written in *machine language*, the Apple's own internal language. Machine language may at first be intimidating, but you do not need to know all about it in order to use it and harness its power and lightning-quick speed. *Nibble* articles have special instructions for entering and saving machine language programs.

Often, programmers use what is called an *assembler* to translate *assembly language* into machine language. Assembly language is slightly more English-like and readable than machine language, which appears to be nothing more than *hexadecimal* numbers, or *hex codes*. Hex codes are usually two-digit numbers, with the letters A through F included as digits (e.g., 01, 23, 5F, and EE are all valid hexadecimal numbers).

If you have an assembler, you can type in the assembly language (or *source code*) listings in an article. If you don't have an assembler, you can enter the machine code directly into your computer. Machine language listings have lines that consist of a three- or four-digit hex number followed by a colon and several two-digit hex codes separated by spaces. For example,

```
300:A2 05 20 DD FB CA F0 03
```

Listing 2 is a short example of a machine language program in a format that we publish in *Nibble*. The following step-by-step instructions show you how to load it into your Apple and run it.

1. From the "J" screen prompt, type CALL -151 and press Return to switch into the System Monitor. You should now see a screen prompt, "*" (followed by the blinking cursor).
2. At the cursor, type

```
300:A2 05 20 DD FB CA F0 03
```

and press Return. Be sure to include the spaces between the pairs of hex characters. You have just entered the first line of the machine language program.

3. At the prompt, type the next line,

```
308:4C 02 03 60
```

and press Return. This is the second and last line of the machine language program.

4. Now press the Control and C keys together, followed by Return to go back to the familiar "J" prompt.
5. To save the machine language program as a *binary* disk file, type

```
BSAVE RINGER.BIN,A$300,L$C
```

The A\$300 is the hexadecimal address in memory where the program resides. It corresponds to the 300 that you used in the first line of the program. The L\$C specifies the length of the program, which contains 12 pairs of hexadecimal characters (\$C is the hexadecimal equivalent of 12).

LISTING 2

```
300:A2 05 20 DD FB CA F0 03  
308:4C 02 03 60
```

To run the program, type CALL 768 and press Return. This causes your Apple to begin running the machine language program at memory location 768 (which is the decimal equivalent of \$300 hexadecimal). You should hear the bell ring five times each time you type CALL 768.

In this column, we have instructed you to press Return after typing a statement or a command. With the programs in the magazine, however, we do not include the Return instruction. Assume that you need to press Return at the end of each program line.

FIRST AID

To help you avoid typing mistakes, *Nibble* has developed the Checkit system, which alerts you of any typing mistakes you might make. The Typing Tips section explains Checkit and also has information about our Technical Support Department, which is devoted to helping you get your *Nibble* programs up and running. ♣

VIEWPOINT continued from page 5

owners are a concerned and articulate group. The company intends to continue selling, supporting, and servicing the Apple II for the foreseeable future. It acknowledges the strategic importance of the Apple II in key markets like education.

- Apple is supporting Apple II sessions at the Worldwide Developer's Conference in May and the A2-Central Developer's Conference in July.
- Apple will become more diligent in including references to the Apple II in its press releases.
- User groups will become an increasingly important part of future Apple II promotional events. Apple-fest-type conferences will be smaller, but will probably appear with more frequency in different regions of the country under user-group sponsorship. Notable examples are the National Apple User Group Conference recently held in Chicago, and the AZApple Fiesta to be held in Arizona.

STAY TUNED...

It's pretty clear that Apple is going to try like crazy to develop a low-cost color Macintosh (LCM). But it's also apparent that an LCM has a tough hill to climb, and it's unlikely to come soon. An LCM will have one additional challenge. *Apple II software compatibility*. No one will confirm any development effort in this area, but software compatibility is an obvious necessity to make a low-cost Macintosh an effective competitor in the low-end market — particularly in education. If nothing else forces Apple II compatibility, the requirement for meeting technical bid specifications in education proposals will be the stimulus. And this is a requirement that IBM and Tandy can now meet.

It's really a shame that Apple Computer still underestimates the Apple II as a competitive system for a broad spectrum of applications. But there are encouraging signs. The Apple II does have its champions. The issues are no longer being ignored. Apple Computer is showing for the Apple II user community. Future decisions will be conscious, considered decisions influenced by financial and market realities.

The bottom line is that there won't be any cataclysmic changes in the short term. Apple still has to define an effective strategy and product line for the low-end market. And the Apple II is still alive and kicking. Stay tuned...

Seatbelts Suggested

Buckle your seatbelts for TransWarp III. More than eight times as fast as the IIe's native speed, with upgradeability to more than twelve times as fast! Frankly, we're obsessed with keeping your Apple II going at maximum speed and TransWarp III for the Apple IIe, II+ and II is the latest result.

TransWarp III is the fastest, most compatible and ONLY upgradeable accelerator on the market. At either 8 MHz or 12 MHz, TransWarp III gives you more speed and compatibility than any accelerator ever designed. Get an 8 MHz model now and upgrade (when available) to 12 MHz by merely switching out a couple of chips. And for II and II+ owners, the card can be upgraded to emulate a 16K card and work in slot 0.

Full DMA (Direct Memory Access) compatibility means you'll never have problems with DMA peripherals like the Corvus Hard Disk and the Ohio Kache Card. And to make everyone in the family happy, we made sure TransWarp III is compatible with all joysticks and sound programs.

Get up and running in no time flat, because unlike older designs, you never need special configuration or pre-boot disks. The built-in Control Panel lets you easily control the warp speed and set slot configurations. TransWarp III works in any slot and comes complete with built-in diagnostics to insure a healthy, fast-running system.

Buckle up and take her to warp speed with TransWarp III!

Transwarp III (8MHz).....\$199

Hi-Res screen. Think it's easy to win at first? This is a smart program — the more you play, the better the Apple gets!

■ **Pyramid** presents a challenging solitaire card game on the Hi-Res screen. Can you disassemble the pyramid and win? Use the card-drawing routines in your own programs.

■ **Fiver Dicer** is a Yahtzee-like dice game that requires a combination of luck and skill. You can play it with a friend or you can compete against your computer.

Order No. **G18** Nibble Game Room . **\$19.95**

NEW!

IIGS POWER ACCESSORIES

■ **Nibble Launcher**, a powerful Apple IIGS control center, lets you launch programs easily, without opening numerous windows.

■ **Speed Set GS** quickly and easily changes the speed of your Apple IIGS. Put away the Control Panel because this common activity can now be done under control of your own software.

■ **Classic Desk Accessories** explores the structure and operation of these utilities. Sandy Mossberg also provides GSInfo, a CDA that keeps you posted on your system's inner workings.

■ **File Tyler** is a Classic Desk Accessory that will display or print any type of file. Because it's a desk accessory, it's always available when you need it.

■ **Memory Peeker Desk Accessory** shows you what's going on inside your Apple IIGS, but you need a way to install it. Sandy Mossberg's utility is the perfect solution.

Note: 3.5-inch disk only.

Order No. **U08** IIGS Power Accessories **\$29.95**

Operating Systems

PRODOS LIBRARY 2

Get a grip on your ProDOS files!

■ **ProDOS TYPE Command** gives you a quick, simple command for printer or displaying the ASCII version of any file. Simply enter TYPE: filename in immediate or deferred mode. To interrupt the output, you just press the Escape key.

■ **ProDOS-DOS 3.3 Doubleboot** lets you boot ProDOS or DOS 3.3 from a single disk. You can choose the system each time you boot up, or have Doubleboot automatically load one system by default. You must own both DOS 3.3 and ProDOS in order to create the Double-boot system.

NEW!

FUN & GAMES

■ **City Centurian** is a lightning-fast arcade game. You patrol the Earth's first moon colony in your shuttle fighter craft and protect its cities from alien spacecrafts.

■ **The Exterminators** will pursue you until they liquidate you, unless you get to them first. You can trick them into destroying each other, or use your Sonic Screwdriver to destroy nearby Exterminators.

■ **Bridges** is a game of clever strategy, with a golden cup as a prize. If you're careful, you can avoid outwitting yourself.

■ **Noggin** will boggle your brain and expand your vocabulary. This game challenges you to make words from the letters it shows on the screen.

Order No. **G19** Fun & Games . . . **\$19.95**

High Performance Utilities

CLIP ART & FRIENDS

■ **Nibble Clip Art** lets you access and use hundreds of professional graphics pictures from libraries like Broderbund's Print Shop, Springboard's Graphics Expander, and Beagle Bros' Minipix. You can clip images, build your own

picture files of up to 38 mini-images, and use them in your own programs with ease.

■ **ImageWriter Color Control** is an AppleWorks preboot program that lets you select one of seven different ImageWriter II colors for printing your files or spreadsheets. Requires IIc, IIGS or 80-column IIe.

■ **Print Shop Label Maker** produces unique and personalized address labels with Print Shop and Beagle Bros Minipix graphic images. You pick where to print the graphics, and you can print up to three labels on each line. Does not support the IIGS printer port.

■ **Write Correspondence** is a collection of AppleWriter WPL programs that turns AppleWriter into an automated address filer and letter writer. Just select the address and it is automatically inserted into your letter and saved for printing the envelope. Throw out the Rolodex!

Order No. **U07** Clip Art & Friends . . . **\$22.95**

■ **Recovering Deleted ProDOS Files** undoes accidental deletes. If you accidentally delete your file, this program will instantly recover it under ProDOS.

■ **ProDOS COPY Command** adds a COPY command to ProDOS for efficient file manipulation. Now you can conveniently copy files while you have a BASIC program in memory, and without resorting to the awkward FILER program. Use it to transfer files from within a BASIC program or an EXECable text file.

■ **ProDOS Directory List** lists every file in all the subdirectories on your ProDOS disks. No more searching through subdirectories for the file you want! Includes print options to the 40- or 80-column screen or printer.

Order No. **Q04** ProDOS Library 2 . . . **\$19.95**

NEW!

PRODOS ASSISTANT

■ **Floppy Copy** is a zippy disk copying program. This program uses your Apple's extra memory to reduce the number of disk swaps. Copy DOS 3.3, ProDOS, and Apple Pascal disks quickly and easily.

■ **File Revival** is Sandy Mossberg's full-featured utility to recover files you've accidentally deleted. ProDOS 8 versions 1.3 and later preserve the directory information this powerful program need

to reincarnate files inadvertently wiped off your disk, even if they were buried in a subdirectory.

■ **OmniType** is a new ProDOS command that quickly shows you the contents of BASIC programs, as well as text, AppleWorks, and other files.

■ **ProDOS Repro Command** is a powerful addition to ProDOS that copies entire directories with a single command. Move a directory of files from one volume to another quickly and easily, or load or clear your RAM disk by issuing a single command. You can speed up file transfer and hard disk backup, easily change the directory of your RAM disk, and selectively transfer only the latest version of your files.

■ **Startup Name Changer** allows you to run any program from any directory when you boot up. Just make sure your program's name conforms to standard ProDOS rules and the path-name is 64 characters or less, and you will never again have to memorize what each startup program does or keep them in the top level of the directory.

■ **Screen Print Command** installs directly into ProDOS, giving you a handy way to print the contents of your text screen.

Order No. **Q07** ProDOS Assistant . . . **\$26.95**

Q My Apple IIc utilities have something called a PIN number that is used to set the serial port. What is this, and how do I set it in my own programs?

A PIN stands for "Peripheral Identification Number," which is a system devised by Apple for condensing the various peripheral port settings into one phrase, so to speak. The numbers in the PIN value represent an entire combination of individual settings. For example, you may have seen communications programs that tell you that the parity setting is "8N1." This translates to "8 data bits, no parity, 1 stop bit." Without digressing to what this specifically means, suffice it to say that 8N1 is just a condensed abbreviation for the combined settings. The PIN value works the same way. There is not a hardware register in the IIc that this value is POKEd into. Rather, it is just a quick way of entering a group of values into a specific utility program that in turn sets the various parameters in the serial port. So, what does the abbreviation mean? The PIN value is a 7-digit code, where each position has the meaning shown in Table 1.

For a printer at 9600 baud, for example, the likely PIN number is 1561111. This tells the serial interface in the computer to be in the printer mode at 9600 baud, with a data protocol of 8N1 (8 data bits, no parity, 1 stop bit), and no echo of printed characters to the screen. The serial card will not add a line feed to each carriage return (the printer is probably set to do this automatically), and the serial port will not truncate lines at 80 characters (or any other value).

Note that this system is not specific to any particular computer, not even the Apple. Anybody that wanted to use this code could accept these definitions for the PIN value. In practice, the PIN seems to be used only by the Apple IIc, and requires a utility on the System Utility disk to take the PIN number and actually send the correct commands to the serial port to make good the desired settings.

If you want to use a PIN value in your own programs, you have to write a routine to take each character of the PIN string and send a specific command to the serial port.

Beat the heat

Heat. The computer user's most insidious enemy. Peripheral cards unavoidably produce heat inside your cpu. Heat that can devastate your whole system. Conserver™ effectively cools your IIGS while it protects against power surges and helps organize your workspace.

A quiet but powerful cooling fan draws air from the top of the IIGS at a rate of 18 cubic feet per minute, lowering the temperature inside by more than 20 degrees to offset the heat produced by expansion cards. The difference can be critical to the life of your computer.

Power surges also invisibly threaten your computer's well-being. They occur when voltage spikes surge through your wiring seeking a place to dissipate. If that place is inside your computer, you'll very quickly gain a greater understanding of the laws of electricity. It's not a pretty sight.

Special line conditioning filters and dual surge suppression circuitry protect against surges, reduce noise and provide "clean" power. Six switched AC power outlets line the rear of Conserver to accommodate your computer, monitor and four other peripherals. Thus protecting your computer and your peripherals from surges. The outlets are conveniently controlled by three front-mounted LED switches.

For beauty, we gave Conserver the same sleek lines of the IIGS and a perfectly matched platinum color. To reduce desktop clutter, the unit was cleverly designed to house two 3.5" disk drives, or one drive and the special diskette holder we include.

Conserver \$99

IT'S BETTER TO FEEL GOOD!

A lot of important ingredients go into the recipe of a great game. You can simmer it with plots and puzzles, baste it with action, and even present it complete with mouth-watering graphics. But unless you include the type of user-interface, the gamer's controls, that can be quickly learned and almost instinctively used then you have just designed a steak without any sizzle.

This month's three games all address the problem of how to make a game "feel" to the gamer in different, and rather unique, ways. All are successful to one degree or another and, even better, they all look as good as they feel. And even comedian Billy Crystal ("It's better to look good than to feel good!") couldn't find fault with that!

A Bountiful Pleasure

King's Bounty from New World Computing is an adventure game that I found I just couldn't stop playing. Unlike so many complex adventure games on the market, here's one that doesn't require the same mental effort to play as to learn College Physics. But the game itself is as deep, as rich in detail, and as convoluted in plotted concepts as the best of its rivals. But in the manner of play, it towers over most of the field.

First, let's get the plot out of the way. In this game, you are a hero who must recover good King Maximus' Scepter. The Scepter was stolen by the dragon Arech, the demon King Urthrax Killspite, and their assorted evil minions. With the Scepter out of his hands, King Maximus is sick, dying. And the land too is dying as more evil creatures begin to appear.

It's the kind of plot that could seem either really laughable or really interesting depending on the rulebook and scenario. This particular rulebook is written in a very nice prose style. Even better, it has been written by someone who knows mythology. The story has an intriguing depth. Readers

Neil Shapiro is founder and Chief Sysop of CompuServe's MAUG. Write to him at MCU Inc., P.O. Box 520, Bethpage, NY 11714.

who know of such things as Odin's Staff, The Wounded King, The Wasteland, and other myths will nod their heads as they read this latest rendition. Other readers will find themselves simply drawn in.

But the greatest story in the world would be nothing if the game could not be well played. In this case, a classic story and a perhaps soon-to-be classic game go hand-in-hand.

Controlled by keyboard, play is very simple. You move your party on an onscreen map of the world, continent by continent. Of course, your party is not the measly five or six adventurers of other games. In **King's Bounty**, entire armies accompany you.

The size of the armies depends on your leadership abilities; the better they are, the greater the size of the armies that will follow you. As you move about, you recruit archers and

pikemen, militia, peasants, and such things as ogres and dwarves, orcs and elves to join you in your quest.

Your quest takes you from castle to castle in an attempt to capture all of Arech's henchmen (henchthings?) and to find the Scepter. Each time you capture an evil one, you get another piece of a map to show you where the Scepter is. You have, depending on game difficulty, a certain number of game days to find the Scepter.

Magic spells can be used (some character classes are better than others) while both adventuring and in combat.

The evil ones hang out in various castles; you will want to "lay siege" to these castles to capture them. Thus, combat can happen in the open or in a castle. But, either way, it is done by tactically moving icons that represent your armies onscreen. Each icon is a

little, animated representation of the type of being depicted — from scaly orcs with huge bows to fairytale-like sprites. The manual carries long and very detailed tables that allow you to plan your battles as to which type of army is better than another, what results to expect, and the like. There's no reason to have to start this game fifty times before knowing what you are doing.

And, hurray for automapping! As you move, the game keeps track of all the terrain, castles, towns, and recruiting spots that you have discovered. Of course, those who enjoy graph paper need not ever access the function but, for people like me, it's a welcome addition.

The only thing I found in the game that I considered a design flaw is that it's a bit too easy to go after the bad-dies. When you go into a town you get a "contract" on which bad 'un to go after. For example, my first contract was on Hack The Rogue. So, I went

from castle to castle looking for him. I stumbled on some of his friends, but my contract was for Hack. But, later, I discovered a quirk of getting a con-

tract. It turns out that if you simply go to a town and keep asking you can sequentially cycle through different contracts. So, if you stumble onto Caneghor The Mystic while looking for Hack The Rogue, just go into any nearby town and change contracts!

Also, as mentioned, much of the game's basic appeal lies in the seriousness with which famous myths are treated and have been incorporated into play. So, I wish the programmer had not given in to humor in the naming of a few places such as Castle Kookamunga. I don't like when a game expects you to believe in it, and yet laughs at itself unexpectedly.

Still, how high would I rate King's Bounty? About as high as the tip of a double-handed broadsword brandished aloft by a tall giant! The game is a wonderful introduction to role-playing and is also deep enough to satisfy the most advanced dungeoneer. I give it my highest recommendation.

King's Bounty is available for the Apple IIe w/128K RAM from New World Computing, Inc., 2031 Ventura Blvd., Suite 200, Woodland Hills, CA 91364; (818) 999-0606. Includes disk, manual. Color monitor recommended. Please circle 120 on Reader Service Card

Is It? It Ys!

The Ancient Land of Ys from Kyodai blends the idea of a role-playing game with the action and reflex excitement of arcade-style gaming. It's a new "feel" to adventuring that, I think, will find many enthusiasts.

It starts off in a town, as do many adventure games. There you use your joystick or keyboard to move about, talking to people and buying various supplies before setting out on your quest.

Your quest in this game is to recover the Six Books of Ys hidden by the evil wizard, Malificus. The books hold a secret, that secret being the magic metal Kureria. Find the books, and obtain the secret.

Of course, there are a lot of creatures out to stop you! How many? Remember how scientist and TV personality Carl Sagan would soulfully recite the term "bill-yuns and bill-yuns of stars?" Well, there are "bill-yuns and bill-yuns" of battles awaiting you in this wonderfully deadly land of Ys!

You fight creatures basically by bumping into them. Run into them, pounce on them, meander into them — but don't run into them head-to-head. The first few hours I played this game, I was toast! But then I realized that coming up behind one of the creatures before butting into it, circling underneath, and generally being a sneaky ol' gameplayer was the best way to pro-

long my onscreen life.

And, it's good that the first creatures are as plentiful and as relatively easy as they are. After a while, once you get the hang of the game, you will begin to get cocky. You will feel like someone in size 10 boots stomping on ants at a picnic.

But the game's no picnic all the way through. The first time you enter a place like the Silver Mine, you'll be in for quite a shock. In fact, I'm not sure I want to ruin the surprise here. So, skip the next paragraph if you don't want a hint of sorts.

Occasionally, you are going to find what are called in the arcades "boss" creatures. These are very large opponents as compared to the run-of-the-mill smaller, knock-into-'em-whocares? variety. If you just bump your way into a Boss creature, good night Nurse! When you come up against a Boss, be sure that you save your game first. You will almost definitely be killed in the majority of battles that

you fight against such creatures. Luckily, the save game feature works here. The key in such a fight is a two-pronged tactic of evade and attack. Most of your time will be spent in evasion. If a Boss touches you, it's like a flame touching a moth. But if you can continue to evade, there will be times when you can quickly dart in and leap up from below the creature. Remember, it seems that only shots from below have much effect on the creature's health. So, completely forget any sort of frontal assault here!

Besides the arcade feel, there are also a lot of adventure-type puzzles to think over. For example, you will find chests that you will not be able to get to until you put two and two together and figure out what an item of equipment is for. And, you will have to visit various places before other places in order to obtain keys and the like.

All in all, the Ancient Land Of Ys is a most interesting addition to the genre of role-playing. It shows that

you really can successfully combine arcade play with adventuring. Of course, like any arcade game, you may find it more frustrating to the beginner than the usual adventure. But, persevere and develop your skills. The payoff is an enjoyable game with its own unique and outstanding feel!

The Ancient Land Of Ys is available for the Apple IIGS from Kyodai, 58 Mitchell Blvd., San Rafael, CA 94903; (800) 521-6263. Includes two disks, manual.

Please circle 121 on Reader Service Card

A Fiery Finish

Firepower from Microillusions is an arcade tank battle with a few differences. For one thing it can be played player against player as well as one-player against the computer. In fact, in two-player mode, both players do not have to be in the same room, or even the same country. Play can be over the phone lines using any Hayes-compatible 1200- or 2400-baud modem.

In dual-player mode, the screen is divided into two windows. If it is player against player, each person sees his or her tank and radar display. If you are playing against an opponent via modem, one half of the screen is your playing area and the other half contains a window with a very simple terminal (telecommunications) program.

When you play against the computer, the screen is a little odd-appearing in that only one-half of the screen is utilized. The other half is simply black. Frankly, I would much rather have seen the one-player mode expanded graphically to take full advantage of the screen size and the optional, two-player modes settling for the windowed modes.

Control of the tank is by keyboard, joystick, or mouse. However, I found the mouse control to be almost unusable.

I simply could not get the tank to respond very well at all to mouse input. But with the joystick or keyboard, the game is fast and playable.

Essentially, the idea is to avoid the enemy tanks and helicopters and to shoot them before they shoot you. Also, many of your soldiers are kept captive in buildings. Shoot the buildings and they run out to your tank; you must give them a ride back to the first-aid station.

Unfortunately, the little soldiers are just brown dots. I can't understand this as, in just a 48K machine, Broderbund in their classic game of Choplifter made quite personable little animated figures to rescue in much the same type of scenario.

Another drawback is there is no manual included! The instructions are just on disk and cannot be printed out. So, as you cannot refer to them during gameplay, it may call for some extra pregame readings onscreen.

But, even with the above problems, I found Firepower to be a very interesting and easy to play and "get into" game. It's one of the best ways around to take your IIGS "to the arcade."

Firepower for the IIGS (768K) is available from Microillusions, P.O. Box 3475, Granada Hills, CA 91394; (818) 360-3715. Includes disk but no manual (see above). Supports joystick, mouse, or keyboard and will utilize a modem for off-site play.

Please circle 122 on Reader Service Card

SPECIAL NOTE: In a previous column, I reviewed Qix for the Apple IIe from Taito. I mentioned that the display made play a bit difficult as it was hard to distinguish some of the enemies (the "sparks"). Well, the new IIGS version is super! If you have a IIGS and have been waiting for Qix — go for it!

the PAIN of typing Apple programs!

Typing perfect, error-free Applesoft programs from magazines and books is a pain. And machine language programs are even worse! With Applesoft, if you make an error you have to retype the whole program line. With machine language, you may have to go back and retype the WHOLE PROGRAM.

AccuType uses word processing techniques to make program typing much faster and easier... for both kinds of programs.

- If you make a slip and leave out some program characters, AccuType lets you go back and INSERT them, without having to retype anything else.
- If you mistakenly insert extra characters, AccuType lets you DELETE them, and the rest of the program is moved to fill in the space — automatically.
- You can even search out a character or word every place it appears, automatically. It's great for finding important program variables and routines.
- And... if you're typing Nibble program listings, you get INSTANT error alerts with precision check codes for each Applesoft program line or each 8 bytes of machine language code.

To correct typos, you just move the cursor over the incorrect characters and retype them. It's that easy to use!

Remember, AccuType works with both Applesoft BASIC and machine language programs. Here's what AccuType users say:

"Accutype is one of those rare utilities that makes you wonder how you ever got along without it."

"I can enter programs I never would have attempted before!"

So, if you want to stop the pain of typing Apple programs... AccuType is for you. You won't find anything else quite like it. Anywhere!

Yes! I want fast, error-free program typing.

Here's my \$29.95 for AccuType. Check One:

DESKTOP DERRING-DO

■ **Publish It!** version 3 offers a host of new features, including: color printing capability, faster keyboard response time, improved graphics importing, increased PostScript support, AppleWorks 3.0 compatibility, Super Hi-Res image importing capability, PrintShop IIGS and Newsroom Graphics compatibility, and Cut, Copy, and Paste Groups. Upgrades to the new version will be available to all registered users for \$30. Otherwise, **Publish It! 3** costs \$129.95. **Timeworks**, 444 Lake Cook Road, Deerfield, IL 60015; (708) 948-7626.

CIRCLE NUMBER 150

THE KEYS TO HAPPINESS

■ The **OmniMac Ultra** offers you a PC-style keyboard for the Apple IIGS. Among its many features are dual sets of function keys — 12 function keys on the left side and 12 across the top. The keyboard also has F13 print screen, F14 scroll lock, and F15 pause keys. The cursor-control keypad has arrow keys laid out in a comfortable diamond pattern instead of the commonly found “inverted T” shape. When a key is pressed, there is an audible click and a slight resistance, and then it springs back up when released. Yet another feature included is Caps Lock, Num Lock, and Scroll Lock LED indicators located above the numeric keypad. The **OmniMac Ultra** costs \$159. **Northgate Computer Systems**, P.O. Box 4100, Plymouth, MN 55441; (800) 548-1993.

CIRCLE NUMBER 151

SPEEDY SCSI

■ Move information up to 10 times faster between Apple IIs and microprocessor. The peripheral devices such as hard disks and CD-ROM drives. The new **Apple II High-Speed SCSI Card** provides the rate of 1MB per second, fastest data throughput available for and at .5MB per second on the Apple IIe and Apple IIGS at no extra cost. The most noticeable improvement in speed is manifested in updated SCSI manager and very large files; the larger the file, the greater the speed improvement. The speed improvement is mainly due to a new feature called direct memory access (DMA) data transfer. Data is transferred directly between the computer's memory and the SCSI peripheral, with minimal interaction

CIRCLE NUMBER 152

NETWORKS GO TO SCHOOL

■ To help educators understand the issues of computer networking, Scholastic Software has released a free 50-page **Scholastic Guide to Educational Computer Networks**. Scholastic has over 50 network software products that run on AppleTalk, Corvus/Apple, and other networks. **Scholastic Inc.**, P.O. Box 7501, 2931 East McCarty St., Jefferson City, MO, 65101; (800) 541-5513; in MO, (800) 392-2179.

CIRCLE NUMBER 153

POOLING RESOURCES

■ Watch tiny crab zoea getting caught in the stinging tentacles of the hydrozoan jellyfish. Marvel at hermit crabs trying out new shells in which to live. Spy on an octopus skulking for food and protecting itself with a jet of ink.

You don't have to travel to the North American sea coast. Just walk to your nearest Apple II, and **Exploring Tidepools**. Five fascinating activities are included in the program. Tidal Cycles helps students understand how tides are affected by the movement of the moon around the earth. East/West Tidepools allows students to compare and contrast West Coast tidepools with a typical New England tidepool. Students may also create their own tidepools within this activity. In Plankton Life Cycles, students gain greater knowledge of what happens to microscopic organisms brought in by the sea at the beginning of each tidal cycle. Who Eats Whom allows students to build food chains and webs of their own. And Reports/Graphs lets students generate both line and bar graphs using data gathered in other Exploring Tidepools activities.

Exploring Tidepools costs \$75 and runs on the entire Apple II family; it includes two disks, backups, and a Teacher's Guide. *Sunburst Communications, Inc., Pleasantville, NY 10570; (914) 769-5030.*

CIRCLE NUMBER 154

MORE THAN AN ELEPHANT CAN REMEMBER

■ New from Chinook Technology is a user upgradeable 4-megabyte RAM card for the Apple IIGS and Apple IIe. It uses standard 1MB RAM chips and may be configured for 1, 2, or 4 megabytes of memory. The card is also DMA (Direct Memory Access) compatible, which means it will work with the new Apple II High-Speed SCSI Card. The RAM 400 costs \$159 configured with 1 MB, \$245 at 2MB, and \$417 at 4 MB. *Chinook Technology, 601 Main Street #635, Longmont, Colorado 80501; (303) 678-5544.*

CIRCLE NUMBER 155

RAW DATA

APPLE II SOFTWARE SALES SLIDING

■ Statistics released by the Software Publisher's Association confirm what you may have deduced from the shelves of your Apple dealer....Apple II software is not a hot selling category. Overall Apple II software sales declined 28.8 percent in 1989 compared to 1988. In the same period, Macintosh sales increased 22.3 percent, and MS-DOS software was up 16.2 percent, and Commodore sales dropped 37.5 percent.

Using data from 152 software publishers, SPA estimates \$42.4 million in Apple II software sales last year. MS-DOS sales were \$698.5 million, and Macintosh \$133.1 million.

Education software is the most lucrative category for Apple II publishers, grossing \$18.5 million last year. However, even this corner of the market lost out to MS-DOS sales of \$20.3 million. In comparison to the prior year, Apple II education sales were down 12.9 percent, with Mac education up 31 percent and MS-DOS up 9.8 percent.

In other categories of software reported for the Apple II, annual sales declines were as follows: desktop publishing, 68.4 percent; graphics, 55.3 percent; recreation, 48 percent; word processors, 34.2 percent; other productivity, 27.6 percent; and integrated packages, 6.1 percent.

The SPA announcement focused on the MS-DOS and Macintosh markets and concluded "North American software sales are clearly on an upward trend."

by Rich Williams

SHARE YOUR DB

■ What can a developer do when he revises a good program to make it a great program? Release the older version as shareware, with hopes of enticing people to purchase the new version. That's what has happened with DB Master 5.0, now available for a shareware fee of \$45 with a full instruction manual. This program is not by any means wimpy. It allows up to 200 fields per record, up to 250 characters per field, and files up to 10 megabytes, running on a hard disk or

floppies. All sorting and searching functions are available, including a powerful report generator. Those who register as shareware users will receive a special offer for the relational DB Master Professional, which retails for \$295. DB Master 5 and Professional will run on an enhanced Apple IIe, IIc, IIc Plus, IIGS, or Laser 128. *Stone Edge Technologies, P.O. Box 3200, Maple Glen, PA 19002; (215) 641-1825.*

CIRCLE NUMBER 156

A DISK WITH A VIEW

■ **Kid-Leidoscope**, a wide-ranging current events magazine on disk with accompanying four-page newspaper, is geared toward students in grades 3-8. Each issue will include a newspaper featuring articles of high interest to students of these grade levels. The first issue focuses on Wildlife, and introduces Kleid, the reporter. Kleid guides students through the issue exploring such topics as the rain forests, extinct animals, and the plight of the dol-

phins. Subsequent Kid-Leidoscope issues will cover Living in Space, Fitness, Money, and Dinosaurs. Through the end of the year, the first issue will cost only \$3 to cover shipping and handling. The cost per issue after that is \$19.95, which includes a double-sided disk and accompanying newspaper. A five-issue subscription costs \$79.95. *Methods and Solutions, Inc., 3130 North Dodge Blvd., Tucson, AZ 85716; (602) 322-6365.*

THE nibble LIBRARY...

You'll Be Amazed At What

It only takes a Minute.

One Minute Apple Programs is packed with nearly 200 easy-to-enter, one- and two-line programs that do incredible things.

You'll like the functionality and power packed into each tiny program. After just one minute of easy typing, you can make your Apple screen come alive with a colorful kaleidoscope. Or, for more excitement, find your way out of a maze, elude a giant snake, or try to dodge the obstacles whizzing toward you on a race track.

Need a momentary diversion? Raise the curtain on a graphics picture, or fracture a text display and watch it fly off the screen.

You'll also get valuable utility programs and plenty of clever tips and routines to get more out of your Apple... and all it takes is a Minute! An optional disk is available with all the programs.

Get One Minute Apple Programs... for Hours of Fun.
Only \$9.95 for the book and \$10.00 for the disk.

Applesoft is EASY.

Hands On Applesoft helps you learn programming the easy way... by writing programs. It is a practical, step-by-step approach for beginners. You learn the art of creating Applesoft programs from start to finish at the keyboard.

Dozens of examples show you exactly how to write, modify, and debug your own programs. *Hands On Applesoft* shows you how to control your disk too. It includes easy to understand instructions for mastering disk operations.

Bugs! The chapters on debugging show you how to untangle the program errors and stamp out the bugs. Whether your goal is to tinker or to really learn programming, *Hands On Applesoft* is the place to start. And you can get an optional disk with all the program examples that includes Turbo Editor (for easy program entry) and Applesoft Tutor (for fast error checking).

Start Your Applesoft Adventure today.
The book is a bargain at \$12.95... The disk is \$14.95.

Unlock the Secrets.

Learn the secrets locked inside your Apple with *Apple Secrets*. This unusual collection of 75 short programs and tips makes your Apple perform in ways you never thought possible.

You'll learn how to make your Apple accept ANY character from the keyboard; how to hide machine code in REM statements; how to make a program that cross references all your variables; and even make a screen scroller that moves your text wherever you want it. You'll create vivid graphics displays, speed up Applesoft, and much more.

Each of the 75 articles is a foolproof method for streamlining your programs, and most include subroutines you can use in your own programs. Even if you're a beginner, you'll enjoy putting your Apple through its paces. And you can even get the programs on an optional disk.

You'll be surprised at what you can do.
The book is \$19.95... and the disk is only \$10.00 more.

Plug into the Power.

Applesoft Power Tools is a library of easy-to-use and very powerful programming utilities. They'll help you to create faster, more professional programs with optimizers, program editors, and documentors.

You'll edit with ease, using the word processor-like features of Applesoft Turbo Editor. It will save you hours of typing. You'll seek and destroy bugs automatically with Programming Helper and Microscope.

You'll squeeze out excess code with the Crunchers, so your programs run fast and lean. Print formatted program

listings, or cross reference your variables and the lines in which they appear. Add sound effects, or your own graphics. Or goof-proof your subroutines. You get them all — ready to type and run.

Plug in Applesoft Power Tools. They're terrific!
Only \$19.95 brings you the whole tool kit.

You Can Do with your Apple

SALE PRICES!
35% off Single Books!
All Six Books for Only \$49.95

Lightning Fast Action.

The Beginner's Guide to Assembly Language teaches you the nuts and bolts of the fastest, most powerful language for your Apple... Assembly Language.

You'll learn how to write fast, flexible routines that turn your Apple into a speed demon. The type of routines that produce professional graphics, full-range sound, and superfast arcade games. Learning is easy, because the book is loaded with side-by-side examples and comparisons to the language that is built into your Apple — Applesoft BASIC.

It puts you in command of the real benefits of Assembly Language: Speed, Power, and Compactness. You don't have to be a genius to learn it. The 12 chapters show you how. And you can even get the program examples on an optional disk.

The Beginner's Guide makes it fun to learn.
The book is \$19.95... and the disk is only \$10.00 more.

More Apple Secrets.

Uncover more mysteries hidden within your Apple with *More Apple Secrets*. It's a treasure trove of more than 70 of the best short Tips and Techniques from Nibble.

Nibble's experts teach you their tricks for creating Macintosh-like windows from Applesoft, automatically converting lower-case letters to upper-case, compressing Hi-Res pictures so that they take up less disk space, and speeding up programs enough to even hear the difference!

You can also learn how to add dozens of new colors to your graphics screen, hide FID in memory, add two-voice music and sound, and just customize your Apple's "beep".

All these programs and many more are yours with *More Apple Secrets*. And you can get the programs on an optional disk.

Discover the power within your Apple.
The book is \$19.95... and the disk is only \$10.00 more.

The Nibble Library is a unique collection of books that contain hundreds of exciting and valuable programs for your Apple. All the programs have easy, step-by-step instructions for putting them into your Apple's memory; you don't have to be a programmer to type and run them. You'll also get comprehensive articles that describe how to use the programs and how they work.

Whether you have an Apple II, II Plus, IIe, IIC, or IIGS, you'll discover that it's a real thrill to see your first program running and to know that you did it yourself!

MEMORY MASTER

Memory Master is an extremely versatile memory editor. It displays a block of memory in both hexadecimal (hex) and ASCII and allows you to edit both directly. You can insert or delete bytes anywhere, and Memory Master either moves the affected memory above the point where bytes are inserted or deleted or "relocates" that part and adjusts addresses and branches accordingly throughout the entire program. It also provides a search facility to examine memory for a specified key, either a text string or a string of hex bytes. You can also move or relocate entire blocks of memory, or fill memory with a specified byte pattern. And you can look at disassembled code without leaving Memory Master. Memory Master runs under either DOS 3.3 or ProDOS without modification.

Why do you need Memory Master? There may be any number of reasons — here are just a few examples:

1. You have several short programs, running at various addresses, that you want to combine. Use Memory Master to relocate the segments.
2. A program that you're writing keeps growing until it has reached an upper limit in memory. Use Memory Master to relocate it to a lower address.
3. You have several programs that run in the same space, and you would like to have them in memory at the same time. Use Memory Master to relocate one or more of them.
4. You have typed in a machine-language program from a magazine article, but you have left out a few bytes or typed one or more bytes twice. Use Memory Master to insert or delete them.
5. You want to move, relocate, or edit a portion of memory for any reason. Use Memory Master to do it.
6. You want to look for a particular string of bytes as either hex bytes or ASCII characters. Find it with Memory Master.
7. You want to view a section of code to look for embedded text. You can see the text clearly with Memory Master.
8. You want to enter a hex dump published in a magazine.

Be the master of
your Apple's
memory

J. Morris Prosser, 3157 Indian Village Rd., Pebble Beach, CA 93953. This program is compatible with DOS 3.3 and ProDOS.

You can do some of these things with an assembler/editor, but that is sometimes less convenient than merely BRUNning Memory Master. And if you don't have source code, you have to go to the trouble of generating it before you can reassemble the code at a different location.

USING THE PROGRAM

After BRUNning Memory Master, you enter ampersand (&) commands to use it. Acceptable forms of entry are "&\$XXXX" (where XXXX is a hex address), "&S" for the search function, and "&R" for the relocate/move function. Entering "&" alone or with any other characters following will result in an error message and a reminder of the acceptable forms. The search and relocate/move functions are available from the display mode as well as directly from Applesoft. To exit Memory Master, press Q.

You invoke Memory Master's different commands by entering various modes. The following section explains each mode.

Cursor Mode

When you call Memory Master with a hex address, e.g., &\$8000, a 128-byte block of memory is displayed on the screen in both hex and ASCII, with the address entered in the top line and a cursor at the top left of the display. The bottom of the screen contains a legend showing the various commands available. The ASCII display has all characters shown in normal mode, except that control characters are replaced with periods. The hex cursor is an inverse ">" and the ASCII cursor is an inverse display of the character at the cursor position — in the case of lower-case characters, the character at the cursor will be shown in inverse uppercase.

You can move the cursor in a number of ways. The I, J, K, and M keys (and the Arrow keys) move the cursor up, left, right, and down respectively. When the cursor reaches the right end of the line, the next entry of K or the Right-Arrow key causes the cursor to move to the left end of the next line down. The reverse action results from left moves. Up or down moves beyond the top or bottom lines of the display result in scrolling down or up as appropriate. For larger jumps, F (for forward) moves the display to the next 128 bytes, and B (for back) moves the display to the previous 128 bytes.

Hex Edit Mode

To get to the hex edit mode, enter H. A flashing cursor will appear and a new message will appear at the bottom of the screen. Entering hex digits now will replace the byte at the cursor position with the new entry, and the cursor will move to the right in position to edit the next byte. Entering any non-hex character will return to the cursor mode. This mode is particularly useful for entering code from a hex dump, since you can type in the bytes continuously, without entering spaces between bytes and without entering carriage returns. If you enter either of these, you will be returned to the cursor mode, since they are not hex characters.

Text Editing Mode

To get to the text editing mode, enter T. A message asking whether the high bit should be set or clear will appear at the bottom of the screen. Enter either S or C and the message will change. The cursor will also change to flashing. Typing any character except control characters will now cause the ASCII code for that character to replace the previous contents of the byte at the cursor position.

```

Figure 1: Memory Master Menu

Entering a carriage return (or any control character) exits to the cursor mode.

Relocate/Move Mode

To access the relocate/move function, enter R. You will be prompted to enter the starting and ending addresses of the block of memory to be relocated or moved and the starting address of the new location (destination).

Relocation means that all internal absolute address references (i.e. JMP, JSR, LDA, BIT, etc. referring to addresses within the block of memory to be relocated) will be changed to the corresponding addresses at the new location. In the case of a relocation, the start and end addresses entered should be those of the normal (run) location, even if it has been loaded at (or moved to) some other address. *Moving* a block of memory does just that — moves (copies) it from one location to another without changing it.

If you select relocation, you will be prompted for the present location of the block of memory. A default address will be shown (same as the start address), and if it is correct you can press Return to accept it. Otherwise, enter the starting location. At this point you will be asked whether all or part of the program is to be relocated (data, text, etc. should be moved, not relocated). If you want to relocate only parts of the program, you will be prompted to enter the start and end address of each segment. As you enter segment addresses, use addresses at the original location, whether or not it is the running location. This makes it easier to determine the segment's new start and end addresses.

When there are no more segments to be relocated, enter a carriage return alone. You will now be asked whether the block should be moved to the new location. You may want to have it remain where it is, perhaps to be saved back to disk, if the new location is otherwise occupied at the time. (If you have selected a move only, of course, the move will be executed immediately, with no further inputs.) Following the relocation or move, the display will return to the hex-ASCII dump in cursor mode, starting at the destination address (unless the block has not been moved, in which case the display will begin with the original address). Note that the relocation operation will take place at the address given for the present location, whether or not the block is moved.

Insert Mode

To get to the insert mode, press Control-I. You will be asked for the end address of the program or data to be edited. The reason for this is that all bytes from the cursor address to the end address will be moved up one position in memory for each byte that is inserted, so the program needs to know the end address. You will then be asked whether to relocate or move the bytes above the cursor position. The meanings of relocate and move are the same as above, except that in the insert mode it is necessary to check and correct all internal branches as well as absolute address references. If you use the relocate mode, you will be asked for the start address of the program to be edited, so these references can be checked. You will notice also that the INS/DEL MODE indicator at the top right of the screen will change as appropriate.

*You can insert or delete
bytes anywhere, and
Memory Master will
adjust the code
automatically.*

Inserting bytes follows the same procedure as the hex edit mode, with any non-hex entry returning to the cursor mode. The contents of memory locations above the cursor position will be moved up as each byte is inserted, and addresses will be corrected, except that any addresses entered in the current insert operation will not be changed. The end address entered must be above the cursor position and the start address must be below the cursor position or they will not be accepted.

Delete Mode

To enter the delete mode, press Control-D. If during the session you have already entered insert or delete mode and you have not moved the cursor outside the start and end addresses that you specified at that time, you will not be prompted for addresses. Regardless, the text at the bottom of the screen will change, telling you that pressing the Space bar deletes the byte at the cursor position, while pressing Return or another control character exits to the cursor mode. No other keys will be recognized. The contents of memory locations above the cursor position will be moved as bytes are deleted, but addresses will not be corrected until you exit delete mode. If the deletion extends to the end of the program, you will be returned to the cursor mode automatically when the end is reached. The last byte of the program cannot be deleted in this mode.

Search Mode

To get to the search mode, enter S. The display will change and you will be prompted for a search key. This may be either an ASCII string or a string of hex bytes. ASCII strings will be converted to uppercase, and during the

search all bytes will be converted to uppercase normal for comparison. This means that any combination of upper-and lowercase, inverse, normal, or flashing can match the search key. If you want the search to be more specific, enter the hexadecimal equivalents as a hex search string.

Within the ASCII search key, you can use the asterisk (*) as a wild card for any character but the first and last. Hex search keys should be entered by first typing a dollar sign (\$) and then hex bytes with a space between bytes, just as when entering bytes in the System Monitor. "AA" is a wild card for hex search keys.

If Memory Master finds the search key, the display will change to the cursor mode, with the matching string starting in the top row and the cursor positioned at the beginning of the string. To search for the next occurrence of the search key, enter C (for continue). When there are no more matching strings found, you will be so informed. You will also be informed if the search key is not found in memory within the specified search range. The start and end addresses for the search mode are not affected by the cursor position.

Reset Mode

To get to the reset mode, enter Control-R. This will give you the opportunity to change the start address of the hex-ASCII display. Enter a carriage return alone if you don't want to change it. The reset mode also resets the INS/DEL MODE to "UNSPECIFIED" and clears the flags which indicate that the end address has been entered and the INS/DEL MODE selected. Note that when you enter R (for relocate/move) the INS/DEL MODE is reset to "UNSPECIFIED" just as with Control-R, but the start address of the screen display will depend on the addresses entered for the relocation or move. The reason for this is that some of the same pointers are used in the relocate/move process, the insert/delete modes, and the hex-ASCII display.

List Mode

The list mode is entered by pressing L. In this mode, a disassembly list is displayed. The list is similar to the disassembly list available in the System Monitor, except that it shows only 16 lines, it can be single-stepped by pressing the Space bar, and it can be paused and restarted by pressing any key except Escape, which exits to the cursor mode. The start address of the hex-ASCII display is not changed. There is an additional command available when first entering the list mode. If the first byte occurs in the middle of an instruction, the disassembly will not be correct. Pressing the Left-arrow key backs up the start of the disassembly list one byte each time, but this occurs only before any other keys are pressed. After another key is pressed, the Left-arrow will start and stop the listing like any other key.

Quit

For a clean exit from Memory Master, press Q while in the cursor mode. This will restore the normal reset vectors and the zero page locations used by Memory Master. This is the only way to exit without adverse effects on other programming.

Notes

The memory range \$C000 to \$C0FF is not real memory, but is used for "soft switches" that control screen displays, peripherals, and so on. For this reason, addresses in this range should not be displayed or searched. Memory Master skips over this range of memory, going directly from

\$BFFF to \$C100 and vice versa. It does not check for moves to this range, so be careful not to move anything there.

If the address range you specify for a search includes the range \$400 to \$7FF, you may get one or more indications that the search key has been found, but the search key may not appear in the listing. This is because that is the text screen memory, and the text screen is changing as the memory dump is printed, so that what was found there by the search routine may not still be there when the listing is displayed. It is impossible to guarantee a completely accurate dump of this range of memory.

You can search for ASCII strings or hex bytes, and wild cards can be included.

Once a search key has been entered, it remains in memory and will be shown as a default, so that entering a carriage return causes the same search key to be used. If you want to change the search key, just type it in. When the first character is typed, the line will be cleared and your input will be accepted. If there is no search key, one must be entered.

Initially, the range of memory to be searched is defined as \$0800 to \$BFFF, which will be shown as defaults. If you want to search through this range, press Return when prompted for start and end addresses. If the relocate/move function is used, these addresses will be changed, since the same pointers are also used for these functions. If you enter different values, they will be retained as the default addresses.

When using the insert or delete modes, you may be undecided as to whether to use relocate or move. If you are modifying a working program, you would normally use the relocate mode. Be careful to insert or delete complete instructions (including operands) during any single insert or delete operation. Otherwise the program may make incorrect changes during the relocation process.

If you have entered a program from a hex dump, as printed in a magazine for example, you will probably want to use the move mode for inserting bytes you have omitted or deleting bytes you have repeated. In this case, the addresses would be correct if all the bytes have been entered correctly. Be aware that if the program being edited contains text or other data, it may be changed in the relocation process. For such cases, it is a good idea to save the data segments separately, replace their memory locations with something that disassembles as a one-byte instruction (e.g., \$EA or \$00), then move the data back in after editing. You could leave the data in place while editing, then replace it later, but there is some danger that relocations following the end of the data portion will be done incorrectly.

Note that, in the insert and delete modes, you cannot enter an end address lower than the cursor position or a start address higher than the cursor position. There is no error message, but the bell will sound and the input will not be accepted. In addition, if the cursor is positioned out-

side the previously entered start and end addresses, new ones will be requested when the insert or delete mode is entered.

In the relocate/move function, the move portion is similar to that available in the Apple System Monitor, with one exception. The Monitor's move function cannot be used to move a block to a higher memory location if the two ranges overlap, because it moves bytes starting from the bottom, which would overwrite some of the bytes to be moved. This program does not have that limitation; it can move even a large block of memory up either many or a few bytes, since it checks the direction of the move, and if the move is up it moves bytes starting from the top. Because of the way the Monitor move function works, it can be used to fill a block with a particular repeated byte pattern. If you want to do this with the routines in Memory Master, enter "F" (for fill) instead of "R" or "M" when prompted.

Be very careful when using the relocate functions, either in the relocate/move mode or in the insert or delete modes, since the program can be severely damaged if the wrong addresses are entered or if the program contains text or data. It is always a good idea to have a backup copy before modifying a program.

When using any function other than the hex-ASCII display, it is possible to cancel the operation and return to the hex-ASCII display by pressing the Escape key whenever an input is expected. If you have started to enter a search key or an address and want to cancel it and start over, press Escape; the cursor will return to the beginning of the input line and the line will be cleared. Of course you can also back up with the Left-Arrow. If the cursor is at the beginning of the input line, or if only a single keypress is expected, pressing Escape will immediately return you to the hex-ASCII display. If you are in the relocate/move mode, pressing Escape before the relocation or move has been made will prevent the relocation or move. Of course, if you have already relocated segments of a program, the changes will not be reversed. In this case it is best to start over with an unmodified version of the program.

In any of the other modes, pressing Escape will return you to the cursor mode.

Control-Reset always returns to the hex-ASCII display, but the start address of the display may be unpredictable, since the pointers for the start address of the display are also used in the relocate/move function.

One area that should not be edited is the zero page of memory. Many zero page locations are used by Memory Master and the Monitor, and some of those used by Applesoft are not reinitialized when returning to Applesoft. Use extreme caution if you change any of these locations.

If you want to run an Applesoft program with Memory Master in place, it is a good idea to set HIMEM:32768 before doing so, especially if the Applesoft program does any string manipulation. The safest thing to do in any case is to BRUN Memory Master just before using it.

ENTERING THE PROGRAM

Type in the hex codes from Listing 1, and save the program with

BSAVE MEMORY.MASTER, AS\$0000, L\$14F2

Due to the excessive length of the source code for this program, we have chosen not to publish it. If you would like a copy of it, simply send a self-addressed stamped envelope to:

Nibble Memory Master

52 Domino Drive

Concord, MA 01742

and we'll send the source code to you at no cost.

THE JUNE 1990 DISK CONTAINS THIS PROGRAM

If you'd rather not type in the listing for this program, you can buy it on disk, complete, free of typos and ready to run. *Nibble's* June 1990 programs are available on a single disk for an introductory price of \$12.95 from *Nibble*, 52 Domino Dr., Concord, MA 01742. Add \$2.50 for shipping/handling within the U.S. and Canada; \$7.50 for overseas air mail. Introductory price expires 8/31/90; after that date, the price will be \$16.95. See the *Nibble Software Directory* in this issue for ordering information. ORDER NO.: W32

LISTING 1: MEMORY.MASTER

Start: 8000

Length: 14F2

FOR THE APPLE IIgs™
AND OTHER APPLE® II MODELS

Parallel Resonance with Damping.
BASIC 213 sec. ISYS FORTH 20 sec.
Iigs ISYS FORTH 5 sec.

ISYS FORTH-83 is designed especially for scientific and engineering applications. Each system includes versions for the IIgs and for older Apple IIs. A version for older Apples equipped with a 65802 or a 65816 is also included.

FASTEST. Uses subroutine threading with optional use of macros.

TURTLE AND CARTESIAN GRAPHICS, including character sets and double hires. The Iigs version supports the new super hires graphics.

FLOATING POINT WITH TRANSCENDENTALS, single and double precision. And double precision integer math, including D°.

MACRO ASSEMBLER for the 6502, 65C02, 65802 and 65816.

MODEST MEMORY REQUIREMENTS. No Iigs memory expansion is needed.

3.5 AND 5.25 DISKS are supported.

PRICE: \$99. This includes all three versions of ISYS FORTH, a 150-page manual and all of the above features. There is no charge for shipping.

ILLYESSYSTEMS PO Box 2516, Sta A
Champaign, IL 61820 Phone: 217/359-6039

Apple and Apple Iigs are trademarks of Apple Computer.

Put Away the Pencils!

Layout Planning Can Be Easy

And while you're at it, put away the scissors and graph paper too! The **Nibble Architect** puts room planning at your fingertips. You create, modify and manipulate up to 50 items per room (including doors and windows), with scaling accuracy to the nearest inch.

Features include:

- Adaptable to all kinds of layouts. Rooms . . . to Gardens . . . to Galleries!
- Grid lines show dimensions up to 99 feet for big jobs.
- 30 graphics editing commands for creating and moving rooms and furniture. Includes HELP command.
- Automatic commands for doors, windows, and exits.

The Architect will produce a printout of the room layout with an Epson MX-80 and Graphtrax, any printer equipped with a Grappler+ or PKASO interface card, or an Imagewriter using the Imagewriter Tool Kit (II+ and IIe only).

Bonus! The **Home Architect** disk also includes **The Shape**, a comprehensive graphics program for creating, editing and saving Apple Shape Tables!

Plan your Garden . . . Landscaping . . . Family Room . . . or Office . . . with the Nibble Architect! Order Today!

I want the Home Architect! Here's my \$29.95 (please add shipping — see below) H07

Protect Your Computer with Quality, Custom Fit, Fabric Dust Covers

In Tan-Navy-Royal-Grey-Red-Brown

- Professional Appearance.
- Unlike plastic covers, ours allow heat from equipment to flow thru fabric.
- Machine Wash & Dry.
- Custom Design/Perfect Fit.
- All Fabric. Won't crack or dry out with age.

WHODUNIT

**Examine the clues
and finger the
murderer**

Did you hear that scream? Someone has discovered the body of Sylvester Sidebottom. The local police are turning to you, a weekend guest on Lord Kingsley's estate, to help solve the crime. Are you an amateur sleuth in an Agatha Christy novel? No, you are playing Whodunit.

Whodunit, as the name implies, is a crime-solving game. The victim is the same each time the game is played, but the computer assigns a different murderer, weapon, and crime location every game. The player must guess the solution.

You might, for instance, figure that Emma Ellsworth, the maid, used the dagger to kill Sylvester in the parlor. The program responds with evaluations of your choices. Through the process of elimination and logic, you'll solve the crime as you might in the popular board game Clue.

USING THE PROGRAM

Whodunit is a self-explanatory program. When you run Whodunit, you'll be given a set of sample instructions, and have access to some facts about the crime. Other facts will be withheld. Your job is to uncover those and guess the identity of the killer.

ENTERING THE PROGRAM

Type in the program from Listing 1 and save it with the command

SAVE WHODUNIT

For help entering *Nibble* listings, see the Typing Tips section.

HOW THE PROGRAM WORKS

Lines 110-200 contain the graphics for the program title. The setting for the crime with descriptions of the characters is in lines 280-370. Lines 390-410 direct the computer to choose the variables randomly. (Note the HGR2 statement in line 90. Putting the Hi-Res graphics on page 2 gets them out of the way and prevents chopping off the end of the program.)

In lines 450-550 the player receives a clue which might or might not be helpful. Simple IF-THEN statements reveal the sex of the murderer, the nature of the weapon (with the appearance or omission of the word "bloody"), and the floor location of the room. Some facts, such as the sex of the hooded stranger, remain the game's secret.

Line 480 slows down the printing so the clue can be read and Line 550 erases it as soon as it is complete.

The player is given simple instructions (lines 580-600), followed by a list of choices for guessing (lines 630-730).

(When I wrote "Whodunit" I numbered the choices and had the player type in the numbers for his guess. I changed that system when I heard my family guessing numbers as they played, and paying no attention to the story angle.)

Lines 740-990 let you enter guesses and lines 1010-1210 give the player a check for error. You can change a guess, with no effect on your performance, until you verify it.

The program evaluates your guesses and tells you if any or all of them are correct (lines 1240-1370). You can study your guess and the evaluation of it as long as you want. Any keypress sends you back to line 620 to guess again.

The winning routine with description of the correct solution is in lines 1390-1630. This is followed by an option to replay, with a new crime.

Constance Fairbanks, 9462 Canfield Drive, La Habra, CA 90631. This program is compatible with DOS 3.3 and ProDOS.

TWO THIRDS OF YOUR GUESS IS RIGHT.PRESS RETURN
TO TRY AGAIN.

Figure 1: Sample guess

MODIFICATIONS

As a veteran elementary school teacher, I recognize a learning device for promoting logical thinking. If you want a program for young children, you might convert it to "What's in the box?" using numbers, color words, and objects as variables. Clues might include descriptive words and categories (many, few, big, little, toys, pets, and so on). Graphics could be added to reveal correct answers.

GALE! The Ultimate Applesoft Editor

(Global Applesoft Line Editor)

10 Reasons to Buy GALE

GALE is a specially-designed word processor for writing or typing Applesoft program lines. It is an indispensable assistant that helps you:

1. Make programming fun! Your typing errors can be corrected instantly, a line at a time, using a couple of keystrokes. Automatic Insert, Delete, Zap, Restore, Find and Replace make it easy, like word processing.
2. Edit really BIG programs. GALE moves itself into upper memory and doesn't take up program space.
3. Avoid conflicts between variable names. Find out which variables you've used and where — with instant cross-referencing.
4. Open up space for program changes. Automatic program line renumbering does it fast — for the whole program or within the program.
5. Cut typing — dramatically. Assign frequently used commands to single keys. Customize your own keyboard! And GALE already has a bunch of built-in shortcuts for functions like CATALOG, LIST, etc.
6. Use common routines without retyping. GALE's merge feature joins programs painlessly.
7. Get the facts! Program pointers, free disk space, lengths, free memory, variable space and more are all available with two-key display commands.
8. Get quick references — with built-in HELP screens.
9. Back it up — GALE is not copy-protected.
10. It includes a 67-page manual with sample sessions.

GALE works with ProDOS and DOS 3.3 on Apple IIc, IIe, and IIGS systems. And you get an unconditional, 45-day money back guarantee. You'll wonder how you got along without it.

GALE - The word processor for Applesoft programs.

SPELLING & GRAMMAR CHECKERS

If you own a word processing program, you have surely heard of these fantastic little utilities called spelling checkers. Hearing of them is one thing; using them is quite another.

A spelling checker, as the term is commonly defined today, compares each word in your word processing document against lists of words called dictionaries. "Dictionary" is a slight misnomer here, since these programs will not give you definitions of words. The "dictionary" in a spelling checker or current word processing program is just a list of words.

When a spelling checker discovers a word not in its list, it flags that word and brings it to your attention. That, in a nutshell, is all a spelling checker does. It does not tell you that you used "there" where you should have used "their." Both are correctly spelled words. Once the word is flagged, how you process it further is up to you.

When the program flags a word, you are usually given several choices, possibly including changing the word yourself if you know the correct spelling; asking the program for a recommended alternative spelling of the word; skipping the word; ignoring the word completely; or adding it to a "custom" dictionary.

There are certain inherent values to this process. The spelling checker is tireless. It does not get eyestrain or fatigue, and it's just as attentive at the end of your docu-

ment as it was at the beginning. It allows you more freedom to compose by letting you ignore typos. If you have a particularly troublesome word that is awkward to type, enter an intentionally misspelled very short word as a substitute for it. The first time the spelling checker encounters this word in the document, edit the word and tell the spelling checker to "replace all occurrences." This is a seldom-used but very powerful capability of spelling checkers.

Grammar checkers, on the other hand, are programmed to look for such problems as certain common mistakes in syntax; faulty use of phrases; overused, repetitive, racist, vague, or sexist words; capitalization; and punctuation errors. They are supposed to make you a more effective writer by pointing out your mistakes in these areas and allowing you to correct them to present a document conforming to current specifications or writing style preferences. They are not infallible.

Both tools are used after you have finished your first draft. They can improve your productivity by allowing you to concentrate on entering your thoughts as rapidly as you can type, leaving the proofreading and correcting chores till later.

One criterion for judging spelling checkers is the size of their dictionaries. This comparison, however, can be misleading. The method of constructing the dictionary can hide the true number of real words in that dictionary. A long list of words made up of root words and common prefixes and suffixes may contain actually fewer real words than a shorter list comprised of all real words. An overlarge dictionary can slow the search speed considerably.

Another factor is the ease with which you can add and delete words to custom dictionaries. This is important in these days of specialized terminology.

The ability to install the program to a hard disk or RAM is becoming increasingly important as memory requirements for programs increase.

The ability to customize the program to your needs and the availability of additional preprogrammed specialized word lists is also becoming more and more important.

Last, but certainly not least, are the hardware requirements for running the program.

Let us examine five currently available programs that can proofread your document for either spelling or grammar errors. For a quick summary of each products features, see Table 1.

SENSIBLE SPELLER

Sensible Speller is a standalone program that has been around for a long time. It works with many ProDOS-based word processor files and has recently been upgraded for compatibility with AppleWorks 3.0. The dictionary, which includes 80,000 words, contains the official word list from the Concise Edition of the Random House Dictionary.

Sensible Speller uses an interface similar to AppleWorks 3.0 (see Figure 1). Once the file and the desired dictionary are selected, Sensible Speller checks all of the words in the document in alphabetical order. The program displays each letter of the alphabet to indicate the progress of the search. Upon completion of an initial search, you can print out a list of suspect words, and then repeat the search with another dictionary if desired.

The only error I found was in the use of the RAMCOPY routine to copy the program from the 5.25-inch disk to a hard drive. (The 3.5-inch disk copy worked correctly.) The problem is in the DATA statements of the RAMCOPY program. The program calls for a source disk named /GRAMMAR. This works fine for the front side of the disk, but the back side of the disk is named /PHRASES. The solution to this is to go into BASIC, load the RAMCOPY program, and add to the program the line

```
2170 DATA "/phrases"
```

Type RUN and enter the correct hard disk prefix when prompted. The RAMCOPY program will then execute properly.

Since this is an older generation program, it relies heavily on the use of ProDOS pathnames. If you're comfortable with this syntax, you'll find the program easy to use. You can use all available dictionary files to process

your document simply by typing in the dictionary pathname when requested. This is not as effective as current point-and-click routines, but it is sufficient.

The documentation includes a number of screen shots and contains a tutorial called "20 Minutes to Sensible Spelling" that guides you through all necessary steps from backing up dictionary disks through demonstrating the checking of a sample file and creating a new dictionary.

Although the program's user interface may seem archaic to users of newer programs, it remains one of the few existing programs available capable of reading some of the older word processing program formats. Sensible Speller Version 1z, which should be released by publication time, is fully compatible with AppleWorks 3.0 word processing files.

APPLEWORKS 3.0

AppleWorks 3.0 runs on all models of the Apple II computer having at least 128K of RAM. The dictionary used in the program's spelling checker is an extension of the Random House dictionary, adding 10,000 common names and terms to that dictionary's 80,000 words.

Along with the Random House dictionary, AppleWorks 3.0 uses a custom dictionary. You can choose between alternative custom dictionaries, but you must select one before checking a document. You can also edit the custom dictionary. To start the spelling checker from within AppleWorks 3.0, your document must be in memory. Then press Open-Apple-V for Verify spelling.

The AppleWorks 3.0 spelling checker performs as described in the documentation (see Figure 2). When you select Verify spelling, Apple

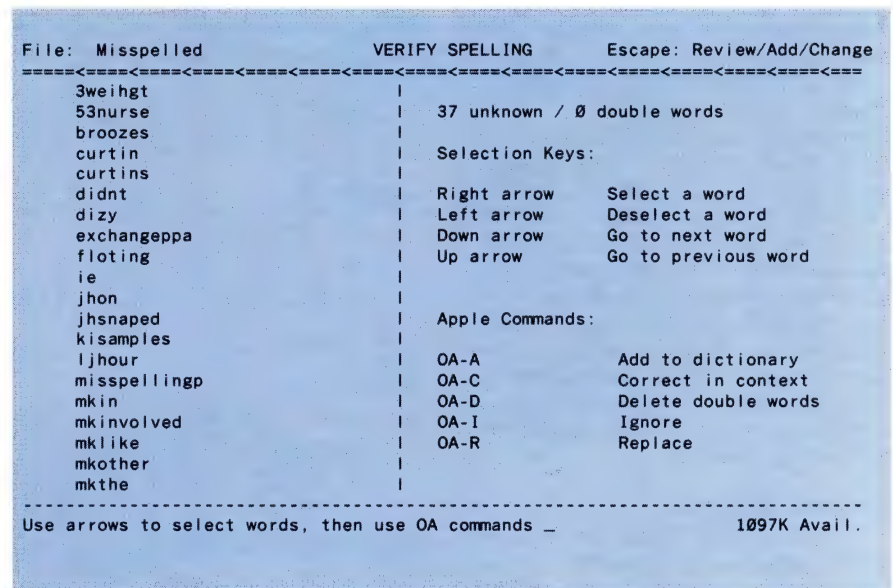

Figure 2: AppleWorks 3.0

Works displays a “thermometer” screen containing three progress indicators. The program quickly scans through the document and then scans the custom dictionary and main dictionary in that order. The program can check spelling in various ways, including from a list or in context, and will even give you a summary showing the original incorrect words along with the corrected versions. The comparison algorithm allows phonetic checking, rather than simply looking for initial letters in a given word. “Filosofikal” will result in a suggested word of “philosophical” using this program.

Like the rest of AppleWorks, the spelling checker forgives your input errors. Pressing Escape and following appropriate prompts will get you out of most normal situations. I tried many different entry and option selection errors and never did crash the program.

This area of the program is extremely easy to use. It follows the standard AppleWorks interface. If you’re already familiar with AppleWorks, you’ll have no problem with this spelling checker. One caution, however, is that you should ensure all the dictionaries you want to use are in the main AppleWorks program directory. For 5.25-inch disk users, these dictionaries should be on separate disks labeled /DICTIONARY.

The documentation for this program is extremely well done. Detailed examples usage are provided in both the AppleWorks Reference Manual and in the AppleWorks Tutorial. Illustrations containing functional flow charts and well-annotated actual screen examples are plentiful and easily understood.

The addition of the built-in spelling checker is one of the more useful improvements in AppleWorks 3.0. Its ability to identify potential misspelled words phonetically is a major improvement also, as is the capability to create lists of misspelled words. The one disadvantage is the necessity for the dictionaries to be in the same folder as the main AppleWorks 3.0 program. With sufficient additional memory, however, the entire AppleWorks program can be loaded into and run from a RAMdisk, which greatly improves processing speed.

TIMEOUT QUICKSPELL

TimeOut QuickSpell, the popular add-on program for AppleWorks, has been recently upgraded for compatibility with AppleWorks 3.0 files. The other prominent improvement in this

version is the new algorithm, the same as that in the built in spelling checker contained in AppleWorks 3.0. This upgrade uses the same Concise Random House Dictionary as the previous version. The program works only with AppleWorks, not with any

*You can
configure
QuickSpell to
look for
dictionaries on
any disk.*

other word processing programs. It is easily installed in a backup copy of either AppleWorks 3.0 or 2.0 by following the instructions in the manual. As with all other TimeOut add-on programs, it is started from within AppleWorks by holding down the Open-Apple key and pressing the Escape key.

The new search algorithm allows QuickSpell to flag phonetically spelled words and find reasonable matches. Since it is compatible with earlier versions of AppleWorks as well as the new AppleWorks 3.0, this new feature is alone worth having. You can also configure QuickSpell to look for your custom dictionaries on any disk

and not just within the main AppleWorks directory. It does not create summary lists of words as AppleWorks 3.0 and Sensible Speller do.

Error-handling is very good in this new version of QuickSpell. Even if you have forgotten to configure the program to locate the dictionaries, a simple press of the Escape key exits you to the previous menu where you can recover. If wrong words are added to the custom dictionary by accident, they can be deleted. Common disk and file location errors and their remedies are well documented in the manual.

Once installed in your AppleWorks program, QuickSpell 3.0 is very easy to use (see Figure 3). The menu choices are simple and concise. Once you start the spelling checker, you are given three alternatives at the bottom of the screen — document, screen, and word — indicating the portion of the document to be checked.

Clear and concise instructions for every aspect of the program are given in the short manual provided with the program. The manual contains actual screen examples of every menu with explanations of all choices. A complete tutorial is provided covering configuring dictionary locations and actually using QuickSpell. The Reference section covers each menu choice in detail. Finally, a Utilities section explains the utilities and suggests uses for any extra RAM available in your particular hardware configuration.

TimeOut QuickSpell 3.0 is not really necessary if you already have AppleWorks 3.0. But the program is also compatible with AppleWorks 2.1, so if you have the older version, upgrading to QuickSpell 3.0 does provide an improved spelling checker for AppleWorks 2.0.

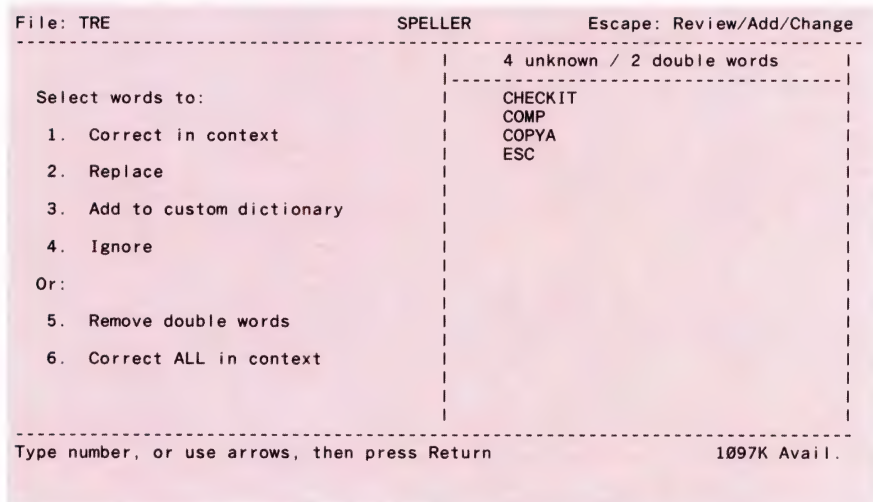

Figure 3: Timeout Quickspell

version into your sentence or leave it as originally written.

Sensible Grammar requires at least a 128K Apple IIe or newer model Apple IIc, IIc Plus, or IIGS computer. It imports files directly from AppleWorks 2.1 and 3.0, AppleWriter (ProDOS), and most of the older word processor formats. Newer word processors with custom formats require first saving or printing the files to disk as ASCII text files in ProDOS. The program comes with one 5.25-inch and one 3.5-inch program disk.

A word of caution: This style of program identifies only common potential errors. What might be an error in one style of writing is entirely proper in another. While grammar is a set of rules, style is knowing how to use and break those rules; this program is no substitute for knowing proper English grammar or having additional style references nearby to resolve questionable syntax or grammatical construction. Sensible Grammar is best at catching common misuse of phrases. As the author, you remain the final judge of what is proper. Many times your original wording will be correct for the thoughts you are expressing in that particular context.

Escape and Cancel options are available at nearly every decision point in this program. If you have entered an incorrect phrase, simply select Escape or Cancel and your entry will be ignored. I couldn't crash the program no matter what I entered. There was always an adequate escape method.

Sensible Grammar is very easy to

learn and use. Simple menu items, selectable by either mouse or Arrow key movement, require no typing in of directory or folder paths. A Quick Configure choice allows you to select the proper document format very easily, and phrases can be added to the library.

The well-organized 68-page manual contains a comprehensive "15 Minutes to Sensible Grammar" tutorial that leads you step by step through all programs and all the possible types of errors it is programmed to identify. Many well-annotated screen shot examples are provided. Detailed instructions are also provided for installing the program on a hard disk. A special "warning" page is provided to ensure that you have the program properly configured for your particular word processor before using it to proofread any of your files. Software replacement policies and customer support information are provided in the front of the manual.

Sensible Grammar is the only currently available grammar checker that works on most Apple II configurations. Its stand-alone capability is especially desirable if you receive or produce documents from different word processor formats. It will not recognize single-word spelling errors, so you need a full-featured spelling checker for initial proofreading. Sensible Grammar will not catch all errors. It identifies commonly misused phrases and punctuation. The user is still responsible for recognizing and correcting individual phrase errors.

CONCLUSION

Spelling and grammar checkers are not infallible; you still must rely on human intelligence to tell the difference between "too," "two," and "to," between "its" and "it's", and other common traps. But they can serve as a second pair of eyes that can find mistakes you might miss, giving your documents one more chance at improvement.

Volume 4

The Apple According to Mossberg

Disassembly Lines

Sandy Mossberg has been exploring, dissecting and demonstrating the machine language that lies beneath Applesoft, DOS and ProDOS in the pages of *Nibble* for over five years. His Disassembly Lines column has entertained and educated thousands of fascinated readers. His work is available in these special book and disk packages. Each volume comes with a disk containing all disassemblies and demonstration programs. ProDOS disassemblies are in Big Mac/Merlin Assembler format.

Disassembly Lines Volume 1 is a collection of the first eight installments of Sandy's column. You'll learn how to use Applesoft machine language in your own programs; how to build an Applesoft Line Editor; how Applesoft handles hex/dec data conversion, program listing and keyboard buffers; and how to make full use of the extended memory of your 64K Apple.

Disassembly Lines Volume 2 delves deeply into DOS 3.3. It explores the base conversion routines, keyboard and video intercepts, and command parsing and processing. An in-depth discussion of the DOS 3.3 File Manager spotlights each DOS 3.3 command in detail. The disk includes an **unpublished bonus**: source files (in Big Mac/Merlin format) for each of the major tables in Applesoft and DOS 3.3!

Disassembly Lines Volume 3 reveals the inner secrets of ProDOS in nine intriguing installments. Learn about the BASIC interpreter and how it identifies your machine; how ProDOS performs speedy "garbage collection" on old strings; how input/output are processed; and how BASIC commands are parsed and interpreted. Find out how to control ProDOS through the global page and buffer management system.

Disassembly Lines Volume 4 explores the second half of the BASIC interpreter, with the focus on commands. Sandy dissects the ProDOS command handlers and the Applesoft BASIC file commands, showing you exactly how commands like CAT and BRUN work. He fixes a bug in BSAVE, and explains the code that ProDOS uses to create a RAM disk.

SWITCHED ON GRAPHICS

The hard facts about soft switches

Sound, color, and motion. My English teacher always repeated these words when she discussed vivid, effective writing. Computer programming is much the same; these three elements can bring a dull Applesoft program to life. This series discusses placing graphics and animation in a program to create effective presentations. In this first article, we review high-resolution graphics and the Apple display soft-switches. Later, we will discuss special drawing techniques, shape tables, and animation secrets that the pros use. We will conclude the series with a brief focus on integrating sound into your programs.

Apple computers have a wide array of display modes. The text screen, 40 or 80 columns wide by 24 rows tall, is especially suitable for showing words and numbers. However, the old maxim "A picture is worth a thousand words" applies especially well to computers. A graph of an equation or an illustration makes obvious what a detailed description cannot. Low-resolution graphics, providing a display window 40 columns by 40 rows, is useful for some games, such as Pong. High-resolution graphics, with 280 columns by 192 rows, is even more useful. This high-resolution mode will be the focus of this series. Newer Apples support a plethora of other modes, including double low-resolution, double high-resolution, and super high-resolution. These modes, however, are more difficult to access from Applesoft.

High-resolution graphics gets its name because, in the original Apple II computer, this mode had the greatest resolution, i.e. the most dots per inch. For the rest of this article, I may refer to this mode as high-resolution or simply Hi-Res. Also, I will assume that you are fluent in Applesoft BASIC and know about the PEEK and POKE commands. In later articles, some hexadecimal numbers and a bit of machine language will be used, but don't worry if you do not know the arcane art. Since the graphics commands are of paramount importance, we will introduce them at this point.

APPLESOFT BASIC GRAPHICS COMMANDS

Applesoft provides four built-in commands for manipulating the high-resolution graphics screen. They are: HGR, HGR2, HCOLOR=, and HPLOT. They can be used from the Applesoft prompt or within a program. Each is detailed below.

HGR: The Apple can display either of two high-resolution screens in its memory. These

Table 1: Standard Monitor Colors

Standard Monitor

0) black	4) black
1) green	5) orange
2) magenta	6) blue
3) white	7) white

*David Harris, 1112 Evelyn Court, Ridgecrest, CA 93555.
This program is compatible with all Apple IIs.*

are called page 1 and page 2. The HGR command displays the first page and clears it to black. The screen is 280 pixels wide (0-279) and 160 pixels tall (0-159). A text window four lines tall is left at the bottom of the screen. An example of this command is

```
10 HGR
```

HGR2: This command is similar to HGR, but acts upon page 2. A field 280 pixels wide by 192 pixels tall (0-191) is displayed, but no text window is visible. In a BASIC program, you might use

```
20 HGR2
```

HCOLOR=: This command is used to set the color for HPGLOT commands. The command must be followed by the color number, between 0 and 7, inclusive. This number determines the color as shown in Tables 1 and 2. An example is

```
30 HCOLOR = 3
```

Table 1 lists the color Apple claims in the *BASIC Programming Reference Manual*, while Table 2 lists the actual colors displayed on an Apple IIGS RGB Monitor. Notice the effect of different monitors on the colors. Of course, monochrome monitors cannot display color, but they display a different pattern of dots for each color. In addition, when lines of different colors are close to each other, they seem to mix and cause strange effects. The reason for this phenomenon is based on Steve Wozniak's ingenious method of displaying color, and will be explained in depth later.

HPLOT: This command draws dots and lines on the screen in the current HCOLOR. If you simply enter HPLOT X,Y, the computer will draw a single dot on the screen at the location X,Y. If you enter HPLOT TO X,Y the computer will draw a line from the last dot plotted to the point X,Y. If you enter HPLOT X1,Y1 TO X2,Y2 TO X3,Y3 TO X4,Y4... the computer will make a "dot to dot" drawing, starting at X1,Y1, and drawing a line to each successive points. This example plots a diagonal line and a triangle:

```
40 HPLOT 0,0
50 HPLOT TO 70,90
60 HPLOT 43,50 TO 95,100 TO 107,60 TO 43,50
```

In all cases, X must be between 0 and 279 inclusive, and Y must be between 0 and 191. If the split-screen mode is active (i.e. four lines of text are displayed, such as in HGR), Y positions greater than 159 are not visible. (They are hidden behind the text.)

Note in Figure 1 that, unlike traditional graphs, the origin (0,0) is in the upper left corner.

GRAPHICS PAGES

The concept of graphics pages (already mentioned under HGR and HGR2) is important for programming the Apple. Within the computer's memory, four different areas are reserved for display of text and graphics. They are referred to as pages. Text page 1 is used for 40- and 80-column text, as well as low-resolution graphics. Text page 2 is almost never used. In fact, Applesoft stores program code there; text page 2 can be displayed only by activating certain soft-switches. For all practical purposes, we can ignore this page. Hi-Res page 1 is the one shown by HGR. Hi-Res page 2 appears identical, and is displayed by HGR2. In addition, some programmers talk about a Hi-Res page 3. Located just above the second Hi-Res page in memory, it cannot be displayed on the screen directly. However, it

Figure 1: Hi-Res Page 1

occasionally has use in animation and special effects.

Using the different Hi-Res pages, you can create flicker-free animation. The key is to draw an image on page one and display it. Then draw a slightly different image on page two and flip to display the second page. Redraw another slightly different picture on the first page, flip back to it, and so on. This technique is much like a cartoon drawn on many sheets of paper that are rapidly flipped. Each page is drawn while the user is watching the previous page.

SOFT-SWITCHES

How do we draw on different pages? The commands HGR and HGR2 cannot do this because they erase the page they display. Instead, we must turn to special memory locations in the Apple called soft-switches. These soft-switches determine what is displayed at the moment. The eight display switches common to all Apple IIs are listed below:

Address	Purpose
49232 (-16304)	Show Graphics Screen
49233 (-16303)	Show Text Screen
49234 (-16302)	Show Full Screen (if in Graphics)
49235 (-16301)	Show Split-Screen (if in Graphics)
49236 (-16300)	Show Text Page 1 or Graphics Page 1
49237 (-16299)	Show Text Page 2 or Graphics Page 2
49238 (-16298)	Show Lo-Res (if in Graphics)
49239 (-16297)	Show Hi-Res (if in Graphics)

The soft-switches are activated by POKEing their address with any number. For instance, to show the text screen, enter:

```
POKE 49233,0
```

or

```
POKE -16303,0
```

The two numbers 49233 and -16303 are considered equal by the computer. Also, you could have POKEd any number other than zero with the same effect; all that matters is the reference to the soft-switch.

Let's learn about these soft-switches by writing a brief program that displays Hi-Res page 1, but does not erase it the way HGR would.

```
10 POKE -16300,0 : REM SET PAGE NUMBER TO 1
20 POKE -16301,0 : REM ENABLE SPLIT SCREEN
30 POKE -16297,0 : REM ENABLE HI-RESOLUTION
40 POKE -16304,0 : REM FLIP FROM TEXT TO GRAPHICS
```

The order of setting the switches does not matter, but I usually like to conclude with -16304. This way, my program will instantly switch from text to graphics without any flicker. If you run this program before clearing the Hi-Res screen, the screen will be covered with random colors.

Don't worry; just type TEXT to revert to text mode.

Note that while in text mode or split-screen text and graphics mode it is possible to display page 2 by POKEing the soft-switch at 49237. This has an exotic effect: the visible text is garbage, and the commands HOME, PRINT, etc. do not appear to work. You are witnessing text page 2, which contains random data (probably the beginning of your Applesoft program). It is not affected by Applesoft instructions, and looks truly awful. Moral: When displaying Hi-Res graphics page 2, be sure to set the full screen graphics soft-switch at -16302.

One more memory location is important for page-flip animation. Applesoft has an internal variable at location 230. (This address is on the zero page at \$E6. The "\$" sign preceding a number indicates that the number is in base sixteen, or hexadecimal. Zero page addresses are those between 0 and 255. Applesoft uses many of them for storing its internal information.) This variable at \$E6 determines the Hi-Res page upon which HPLLOT will act. HGR and HGR2 automatically take care of setting the variable, but when you wish to draw on a different page while using the soft-switches, you must handle this variable yourself. In order to draw on Hi-Res page 1, enter POKE 230,32. Use POKE 230,64 for page 2. This switch also allows drawing to the invisible page 3 by writing POKE 230,96.

EXAMPLE PROGRAM

In summary, we have reviewed Applesoft's built-in

drawing commands. We have learned about the different graphics pages and how to access them. And we have learned about using soft-switches to control the display directly.

Now we are ready to incorporate all of this knowledge into an simple animation program. Enter the program in Listing 1 and save it to disk with the command

SAVE HPLLOT.DEMO1

This program draws a ball, and, using page flipping for flicker-free animation, shows it bouncing across the screen. Lines 110-130 clear the screen and draw in the ground. Lines 140-160 read in the data for the ball's shape and initialize several variables.

The heart of the program is the animation routine, lines 210-310. The current drawing screen is set in line 310, so that the ball will be drawn on the screen not currently seen. Then the old ball is erased and a new ball is drawn. When it is completely drawn, the program flips to the new graphics page and reveals the ball in its new position. This process repeats on alternate screens, moving the ball just slightly each time, creating the illusion of motion.

The motion is flicker-free, but rather slow because of the number of lines that must be drawn. In a future article, we will learn how to use block shapes to create animation that is far, far faster.

The ORCA™ Family of Languages for the Apple IIcs

ORCA/C™ is powerful enough for the professional programmer, yet so easy to use that the beginner will have no trouble learning C with this compiler. ORCA/C features function prototyping and standard ANSI C libraries. A separate samples disk packed with examples is also included. *Requires 1024K of memory.*
\$150

COMPILER FEATURES

- Full access to Apple IIGS toolbox.
- Excellent optimizations for fast, compact code.
- Define and access your own libraries.
- Write stand-alone programs, shell programs, CDAs and NDAs.
- Supports partial compilation for compiler speeds in excess of 10,000 lines per minute.
- Large and small memory models.

ORCA/PASCAL™ is a complete, stand alone ISO-ANSI standard compiler plus extensions. Included are UCSD-style units; in-line tool calls; type casting; OTHERWISE clause in CASE statements; additional data types of longint, double precision, and byte and much more. A separate disk FULL of free samples is also included. *Requires 1024K of memory.*
\$150

DESKTOP ENVIRONMENT

- Pull down menus.
- Multiple windows.
- Cut, copy, paste, undo and split screen.
- View text and graphics at the same time.
- Copy or delete disk files, initialize disks.
- Run desktop programs without leaving the environment.
- Access the shell from the desktop.

SOURCE LEVEL DEBUGGER

- Debug desktop programs, NDAs, graphics, or text programs.
- Step, trace and full speed execution.
- Execute to end of subroutine.
- Step through a subroutine.
- Break points.
- Watch variable values change.
- All debug code can be turned off for smaller faster code.

YOU CHOOSE THE ENVIRONMENT

- All languages ship with a UNIX-like text environment.
- C and Pascal also include ORCA/Desktop.
- Any ORCA language can be used from either environment.
- Install all of your languages in either environment.
- Easily write programs in more than one language.

ORCA/M™ is our enhanced version of APW — THE standard development environment for the Apple IIGS. ORCA/M includes ASM65816 - a fast and sophisticated macro assembler, a UNIX-like shell with over 50 built-in commands, and our standard linker which performs automatic library searches and links any standard OMF object modules. *Requires 768K of memory.*
\$69.95

ORCA/Desktop™

is the easy way to use the ORCA/M macro assembler and other APW-compatible languages. A complete, mouse-based desktop programming environment, ORCA/Desktop features multiple windows and pull-down menus. Text and graphics can appear on the screen at the same time allowing source code and output to be viewed simultaneously. Also included is a native code debugger. (ORCA/Desktop is included with ORCA/C and ORCA/Pascal.) *Requires 1024K of memory when running with ORCA/M.*

SMART COLOR FILL

Smart Color Fill is a short machine-language program that will fill almost any black area with the colors designated by the Applesoft HCOLOR command (1, 2, 3, 5, 6, or 7).

Last spring, I needed a fill routine to accompany a graphics program on which I was working. The routine had to fill complex areas, meaning I couldn't just use one of the commercial fill routines available. (The majority of these are geared for speed, and the ability to fill complex areas would slow them down unacceptably.)

So, I had to write my own fill routine. The first thing I needed was an algorithm for complete filling. Computer graphics journals have published numerous articles about filling algorithms, so I checked through the ones at a university library. No luck. Most of the algorithms were described in a very hazy pseudocode, or were written in a computer language that hasn't been used in 15 years or so. The rest of the algorithms were impractical for anything less than a mainframe. So I had to come up with my own algorithm.

Brent Iverson, Select Software, 9538 Pondwood Road, Boca Raton, FL 33433. This program is compatible with DOS 3.3 and ProDOS.

USING THE PROGRAM

To use FILL.DEMO (Listing 1), just run the program and watch the Hi-Res screen. It will plot a few patterns on the screen, make calls to the filling routine, make a short buzzing sound, and end. The filling part of the program takes 20 seconds.

FILL.BIN will fill a black area enclosed by most non-black boundaries. The fill color must be between 1 and 7. To use this routine from Applesoft, you must first initialize certain memory locations in the following manner:

```
POKE 6,X-(X-255)*256
POKE 7,X-255
POKE 8,Y
POKE 9,C
```

X and Y represent the screen coordinates at which the filling will start, and C is the fill color (1-7). Once you've done this, call the routine with

```
CALL 16384
```

ENTERING THE PROGRAM

To enter the routine, you can type the source code from Listing 2 into the Editor Assembler (if you have it), and save the object code as FILL.BIN. Or you can type in the hex codes from Listing 3. First enter the Monitor with

```
CALL -151
```

Save the file with the command

```
BSAVE FILL.BIN,A$4000,L$30D
```

To enter the demonstration program, type in Listing 1 and save it with

```
SAVE FILL.DEMO
```

For more help with Nibble listings, see the Typing Tips section in this issue.

HOW THE PROGRAM WORKS

FILL.BIN uses an algorithm that works this way:

1. It searches to the left from the starting point until it reaches a colored dot. It stores the position of the dot to the right of this one as *Left*. Then, it searches to the right from the starting point until it finds a colored dot. It stores the position of the dot to the left of this one as *Right*. (See Figure 1. The X is the starting point of the fill. The dots are colored pixels. The other pixels are black, or uncolored.)
2. From left to right, it searches one row above the starting point for the dots in uncolored spaces that are farthest

to the left. In this case, the only one is at X1. It pushes this position onto the stack.

3. It searches from left to right, one row below the starting point, for dots as described in step two. In this case, it will find X2 and X3, and it pushes them onto the stack. Figure 2 shows the state of the stack, as well as the points we've found so far, after step three has been carried out.
4. The algorithm picks a new starting point from the top of the stack (in this case, X3), and starts over at step one.

Because of the way color is obtained on the Apple, this program will not fill areas of two dots or less, and frequently will miss areas of three dots. If the program were able to fill in these areas, it would also fill between the alternately spaced dots of nonwhite lines.

This program is not as fast as the filling routines used in Hi-Res adventures, because those don't have to check above and below every dot in a row, as this program does. Filling the entire screen takes about 17 seconds.

The routine will fill any area with any Hi-Res color unless the area is exceedingly complex.

MODIFICATIONS

FILL.BIN will fill any area unless the area is exceedingly complex (and the program runs out of stack space). If this happens, the program will end with the area only partially filled. If you want to increase the stack space available to the program (to allow it to fill very complex areas), just increase the value of LIM in the source listing.

The program is assembled just above the first Hi-Res page. If you want to assemble it at a different location, just remember to change the address of STBASE (the location of the first byte of storage for the stack used by the program).

The stack uses (3 * LIM) bytes, starting at STBASE.

8-BIT DEVELOPMENT SYSTEM APEX BRINGS IT ALL TOGETHER.

- Provides both MAC-graphics screen and Apple II command line entry.
- Now you can program with screen buttons, icons, pull-down menus, mouse pointer on HIRES and DHIRES with your standard II.
- Includes built-in editor with character insert/delete and line edit/move plus over 50 editor commands.
- Easy Applesoft Conversion — Uses ProDOS.
- Uses Standard Fonts — hundreds available.
- APEX code is 100% tokenized for compact programs which load fast and run fast.

ROLL OVER BEETHOVEN.

**LightningScan GS. Thunderware's
new hand-held scanner. With SnapGuide.**

Our latest scanner roll-out is worth a little arm waving. LightningScan GS scans images up to four inches wide instantly from books, artwork or anywhere else. And only LightningScan GS has SnapGuide™ for straight and steady scanning.

LightningScan GS works in concert with ThunderScan® software. So you can save images for paint and publishing programs in every display mode. And only LightningScan GS offers 16-level gray scale.

LightningScan GS can be yours for just \$295 complete. So get rolling to your dealer and pick one up today.

Thunderware

LightningScan®

21 Orinda Way Orinda, CA 94563 415/254-6581 FAX: 415/254-3047

Celebrating 10 years as an Apple developer.

LightningScan GS requires an Apple IIcx™ with at least one megabyte of RAM. LightningScan, SnapGuide, and Thunderware are trademarks of Thunderware, Inc. Apple IIcx is a trademark of Apple Computer, Inc. ©Copyright 1990 Thunderware, Inc. All rights reserved.

OUR POLICY

- VISA and MASTERCARD accepted. No surcharge. Your credit card is not charged until we ship.
- If we must ship a partial order, shipment that completes is sent free.
- All shipments insured; no additional charge.
- Upon receipt and approval, personal and company checks clear the same day for immediate shipment.
- No sales tax except orders shipped within CT, add 8% tax.
- COD maximum \$1000, cash or certified check. COD orders ship via UPS Blue Label unless UPS Ground delivers next day.
- 120 day limited warranty on all products. Defective software replaced immediately. Defective hardware repaired or replaced at our discretion. Prices subject to change without notice. All items subject to availability.
- For Purchase Orders or Corporate Purchases please call our business office, 203-378-1926, 9am-5:30pm EST. Purchase Orders accepted at our discretion.

SHIPPING

- **Continental U.S.:** Add \$7.00 minimum per order to cover Federal Express Standard Overnight Service, unless UPS ground delivers next day. Some areas require an additional day. (UPS ground service available at reduced rate per customer request.)
- All (instock items) ordered by 5:30pm Eastern Time Monday thru Friday will ship that evening for overnight delivery, barring computer failures or other catastrophes.
- **Alaska, Hawaii, outside Continental U.S.,** APO and FPO: call (203) 378-3662 or write for shipping information.
- Mail-in orders (especially from foreign countries), please furnish telephone or fax number.

POKING

DYNAMIC

Displays

Buy
your
text
a
ticket
to
ride

Most of your programs probably begin by displaying your name and the name of the program. This is fine, but it's easy to make your title screen much more attractive, even with a minimal display of text.

Using the BASIC command POKE, it is easy to create a title screen with moving characters that will catch the user's eye. Such dynamic displays require little code, use little memory or disk space, and can be easily bypassed with a keypress.

"PRINTING" WITH POKE

Using POKE you can place values directly into specific memory locations (POKEing a short machine language routine into memory, for instance). Since the screen display is stored in the Apple's RAM, POKE also can be used to "print" to the text screen.

Figure 1 shows a map of the text screen memory. Apple's primary text screen uses RAM locations from 1024 to 2047. Any value POKEd into this area will be displayed on the screen. The 24 lines and 40 columns of the text screen require 960 bytes of memory. (The other 64 bytes, 8 each at the ends of lines 17 through 24, are used as scratchpad RAM for the eight peripheral slots.) Using Figure 1, you can determine the address of any screen memory location; for example, VTAB 20, HTAB 10 is memory location 1497 and VTAB 2, HTAB 3 is 1154.

George Tylutki, P.O. Box 73, La Plume, PA 18440. This program is compatible with DOS 3.3 and ProDOS.

Figure 2 provides a simplified table of the ASCII character set. Although there are 256 values in the full ASCII table, the 192 values shown here cover the usable range on the Apple II (excluding lowercase). Using the POKE command, you can "print" any character in the ASCII set, in NORMAL, INVERSE, or FLASH mode, anywhere on the text screen. For instance, POKE 1030,129 places a normal A at VTAB 1, HTAB 7. POKE 1030,65 places a flashing A at the same spot, and POKE 1030,1 places an inverse A there.

WHY POKE INSTEAD OF PRINT?

Why not just use the PRINT command? There are several reasons for printing with POKE.

(1) Sometimes it is just simpler to use POKE. For example, POKE 1552, 26 is easier to type than VTAB 5: HTAB 17: INVERSE: PRINT "Z": NORMAL.

(2) It is easier to mix normal, inverse, and flashing characters using POKE. Instead of keying in 10 commands —

```
10 HOME: VTAB 7: HTAB 7: INVERSE:
PRINT "A": NORMAL: PRINT "A":
FLASH: PRINT "A": NORMAL
```

— you can key in 4 commands:

```
10 HOME: POKE 1798, 1: POKE 1799,
129: POKE 1800, 65
```

(3) You can POKE text into column 40 or line 24 without worrying about scrolling. For example, VTAB 24: HTAB 40: PRINT "!" causes the screen to scroll, but POKE 2039, 161 doesn't. You can also POKE inside or outside of text windows or anywhere else as many times as you want and wherever you want.

(4) It is easier to POKE dynamic displays than it is to PRINT them. Using only FOR...NEXT loops and POKE, you can move characters vertically or horizontally across the screen. To do the same thing using PRINT, you must use FOR...NEXT, HTAB, VTAB, often INVERSE, FLASH and NORMAL, and sometimes the MID\$, LEFT\$, and RIGHT\$ functions. By printing with POKE, you can highlight individual letters in a word or words in a line, create moving character displays, move a pointer on screen while waiting for a keypress, and so on.

ENTERING THE PROGRAM

The program in Listing 1 demonstrates some of the possibilities of using POKE for printing, especially for animated displays. Type it in and save it with

Figure 1: Text Screen Memory Locations

SAVE DYN.DISPLAYS

The program begins with an animated menu offering five choices — including the menu, you have six different demonstrations using POKE. Each demo (except #3) will ask you to type in a string of characters; then your string will be moved about the screen in interesting ways. Demo #4 does not move your string, but creates a moving border around it; you can change the border with a keypress.

The demos are contained in subroutines; each is a bit more complicated than its predecessor. In order to make the method of POKEing to the screen clearer, I have placed any lines that the subroutines share (look at the paddle for delay, clear the screen, get a key) in external subroutines. The program will run on any Apple in 40-column mode. It will run on the IIe in 80-column mode, although the menu pointer will be displaced. The complete ASCII table and text screen memory map can be found in the *Apple II Reference Manual*.

BACK AND FORTH

It is easier to move characters across the screen than up and down the screen. To move an inverse asterisk (ASCII 42) horizontally requires that only one variable contain a screen memory location (L). Then, using a FOR...NEXT loop consecutive locations can be accessed. For example,

```
10 HOME: L=1408: FOR X = L TO
L+39: POKE X,42: POKE X,160:
NEXT
```

Figure 2: Values to POKE to Text Screen Memory (I = Inverse F = Flashing N = Normal)

The ASCII value for a space is 160; it erases the asterisk. Timing is important in moving displays. If you typed in the last line, you saw (or didn't see) the asterisk fly quickly across the screen. You can slow the movement down by inserting a delay loop.

```
10 HOME: L=1408: FOR X = L TO
L+39: POKE X, 42: FOR D = 1 TO
100: NEXT: POKE X, 160: NEXT
```

You can slow down or speed up the demonstrations by adjusting the number 100 in line 320. Also, GOSUBs and GOTOs cause delays. Proper timing requires experimentation. If you compile this program or any program with a moving display, the display will run much faster than it does in BASIC (often too fast, as with the menu pointer when paddle 0 is set to 0). Moving displays also can be written in assembly language or directly in machine code, and they run extremely fast.

SIMPLE DEMO

In demos #1, #2, and #5 I use the MID\$ and ASC functions to demonstrate how to convert input from the keyboard to the proper values for POKEing (LN=Letter Normal, LI=Letter Inverse). This makes the

Nine reasons The Assembler is a red-hot best seller.

SAVE! \$12.00 on
Beginners Guide
to Assembly Language

1. Ease of Use. Beginners will enjoy writing assembly language programs with this menu-driven Macro Assembler/Editor, complete with Help screens. No memorization! **2. Power.** The more advanced user will appreciate the power, speed and convenience of designing and using Macros. **3. MacroSoft.** Consider the purchase of this powerful macro language. Lets you write Applesoft-like programs that are compiled directly into standalone machine language. **4. Adaptability.** Automatically adapts to whatever Apple you have, whether it's 40 or 80 column display, upper or lower case, or extended memory. **5. Advanced Features.** Powerful Editor. Subroutine Library. Macro collections. Support for the 65C02 microprocessor. **6. Superior Documentation.** Concise, easy-to-follow manual with lots of examples. **7. Support.** You're always just a phone call away from free help and advice. **8. Reputation.** Thousands of satisfied Assembler users have helped make MindCraft the leading publisher of programming aids like GALE, ProAmperSoft and AccuType. **9. Price.** At just \$49.95, The Assembler's the best value you'll find — anywhere! And you can SAVE \$12.00 off the retail price of the best selling book: *Beginners Guide to Assembly Language* when you order The Assembler. You'll learn the nuts and bolts of A/L programming with more than 30 hands-on examples!

Includes both ProDOS and DOS 3.3 versions.

demos more interesting because you can use your own strings instead of preprogrammed strings. Unlike lines 410-420, lines 510-540 will accept any input except commas and Control-C as the first character of the string. To run the demos without requiring input from the keyboard you should set up the variable values as in demo #3 (lines 620-630).

Demo #1 (lines 1310-1470) first asks you to type in a string of characters (GOSUB 510). Left to right, it prints each character of the string, first as INVERSE (line 1320) and then at the same screen location as NORMAL (line 1340). Thus, a white mask one character wide seems to move over the string. If you press a key during the demo (GOSUB 330), the mask reverses direction and moves right to left (lines 1390-1460). It will reverse direction each time you press a key. Lines 1380 and 1450 determine whether you have pressed the Escape key; if so, the program returns

*These techniques spruce
up your programs without
wasting disk space.*

to the menu via line 1470, which zeroes all variables, including arrays and strings, and sets the pointer value (CC) to 173 (the ASCII value of the dash). Demo #1 shows in a simple form how to move a character back and forth across the screen, highlighting individual characters within a string.

UP AND DOWN

To move characters up and down the screen requires that a different variable contain each screen position (SP) (see lines 130 and 170). Line 130 first sets three variables for the loop in line 170: B = Beginning, E = End, and S = Step. SP(1) to SP(6) contain the values of the six screen memory locations, one below the other: VTAB 5, 7, 9, 11, 13, and 15, HTAB 9. At the beginning of the program, POKE -16368,0 clears the keyboard strobe for the first PEEK (-16380) in line 330. After the menu is printed to the screen, line 170 POKes each of the six vertical screen locations with the value of CC, which is set to 190 (>) in line 110. The value of CC (the pointer) is changed after each demo. I could have drawn an arrow (--->), but I wanted to keep things simple.

GOSUB 320 establishes the delay between each POKE. POKE SP(X), 160 erases the pointer. Thus, the pointer is POKed to the screen in front of each numbered menu choice, erased, and then POKed to the line below. K is a flag indicating that a key has been pressed (GOSUB 260). The ON...GOTO in line 210 sends the program to the appropriate subroutine, because the ASCII value of "1" is 177, "2" is 178, etc., and subtracting 176 from P will yield 1, 2, and so on. If no key is pressed, the pointer is moved six times down the screen. Then execution of the program continues at line 170, only now the pointer is moved up the screen, because line 180 reverses the values of the loop (B becomes E, E becomes B, and the step becomes negative). The menu illustrates the basic technique of using POKE to move characters vertically.

NOTES

Each screen line is composed of 40 consecutive memory locations. However, lines are not stored consecutively in memory: Location 1063 is the last column of line 1, but 1064 is the first column of line 9 (Figure 1). Therefore, if you enter a string longer than 19 characters in demo #5, the characters will not jump over or under to the next line but to the eighth line below. Try it.

Notice in demo #5 (lines 810 and 840) that changing one value (D) is all that is necessary to make the characters move over or under the string printed on screen line 9 (1064). If D=1192, the characters will move under; if D=1920, they will move over. This also illustrates one reason for using variables rather than constants: The functions of complex statements can be easily modified. Using variables also speeds up program execution in Applesoft.

Three blank spaces (ASCII 160) are added to the end of the data string in demo #3 (line 630) to bring the characters down out of the air in the loop (line 700).

Line 1080 sets the two values that are POKE'd for the border (demo #4) to the dash (—) and underline (—) characters. When the demo is first run, alternately POKE'ing the two values makes it appear that one character is jumping up and down.

Dynamic displays such as these will not replace multicolor Hi-Res displays. However, you can spruce up your programs using this technique without wasting disk space, memory space, your programming time, or the program user's time.

END OF LISTING 1

Entering hexadecimal numbers on a normal keyboard can be a frustrating experience. The digits 0 through 9 are all in a row at the top, and A through F are scattered about the keyboard. Even though a numeric keypad eases the task of decimal data entry, it offers little help in entering hexadecimal data.

However, if you own an Apple IIGS, help is available. By using HexPad, you can configure your numeric keypad to act as a hexadecimal keypad, with the digits 0 through F within easy reach of one hand. In addition to the letters, you also gain a space character on the keypad. It may take some practice before using HexPad becomes second nature, but the time and effort is well worth it.

Even if you don't enter much hex data, you may still find HexPad's decimal mode useful. In this mode, any key on the numeric keypad can be changed to a comma key. This can be a great time-saver when typing lengthy DATA statements.

USING THE PROGRAM

To install HexPad, boot into ProDOS and type BRUN HEXPAD. HexPad then makes sure that it is running on an Apple IIGS. If so, an installation message will be displayed.

HexPad recognizes the four commands listed in Table 1. After a command has been entered, HexPad sends a "cancel input" signal (Control-X) to Applesoft. This means that any pending input will be cancelled when a command is executed. For this reason, you should enter the HexPad commands only at the beginning of a line, unless you don't want the characters that you have already entered to be acted upon.

The default mode is normal, in which the numeric keypad acts in the same way that it would without HexPad.

Table 1: HexPad Commands

Keypress	Function
Open-Apple-D	Set decimal mode
Open-Apple-H	Set hexadecimal mode
Open-Apple-N	Set normal mode
Open-Apple-C<keypad key>	Maps the comma to <keypad key> in decimal mode

In hexadecimal mode, several keys on the numeric keypad are mapped to other characters, as shown in Table 2. For instance, when you press the Clear key, a capital A is generated instead of the normal Control-X code. You can still generate all of the keypad characters by using the equivalent keys on the keyboard. For instance, to generate the "=" character, use the equals sign on the keyboard rather than on the keypad.

In decimal mode, the comma is mapped to one of the keypad keys, and all of the other keys behave normally. You can choose which key you wish to act as a comma with the Configure command. Type Open-Apple-C followed by a keypad key. The key you select will act as a comma. The default key is the minus sign.

Mark A. Heath, 2001 Pearson Drive, Midwest City, OK 73110. This program is compatible with the Apple IIGS only.

Table 2: Remapped Keys in Hexadecimal Mode

Keypad Key	Character generated
Clear	A
=	B
/	C
*	D
+	E
-	F
.	Space

HexPad can be disconnected with the command `IN#0`. If you wish to reconnect HexPad, use the command `IN#A$300`. From within a program, the commands should be executed as

```
PRINT CHR$(4); "IN#0"
```

and

```
PRINT CHR$(4); "IN#A$300"
```

HexPad will also be disconnected if you press Control-Reset, type `PR#3`, or type Escape-Control-Q while the 80-column firmware is active. The `IN#A$300` command will reconnect HexPad in these cases as well.

ENTERING THE PROGRAM

If you have an assembler, type in the source code in Listing 1. The `XC` command in line 27 tells the Merlin Pro assembler to generate 65C02 opcodes. If you're not using Merlin Pro, omit this line. Assemble the program and save the object code with the filename `HEXPAD`.

If you don't have an assembler, enter the Monitor with `CALL -151` and type in the hex code in Listing 2. While still in the Monitor, type the command

```
230<2000.2168M
```

Press Control-C and Return, and then type

```
BSAVE HEXPAD,A$230,L$169
```

Updating Checkit

HexPad can be a great aid when entering long hex listings. *Nibble's* Checkit program can also be quite helpful. However, Checkit contains its own input routine and will bypass HexPad if it is installed.

Fortunately, Checkit can be easily updated to accommodate HexPad. Follow these steps:

1. Type `LOAD CHECKIT`
2. Enter the following Applesoft lines:

```
55 PRINT CHR$(4); "— HEXPAD"
100 POKE 216,0: POKE 921,0: DIM H(3): H(0) =
  1:H(1) = 16: H(2) = 256: H(3) = 4096
140 POKE 921,1: VTAB 10: CALL -958: PRINT "WHAT
  IS THE STARTING ADDRESS OF THE": PRINT "FILE
  (IN HEX)": INPUT H$: GOSUB 290: A = H
155 IF A < 1024 THEN POKE 0,0
260 IF PEEK (921) = 1 THEN PRINT "ENTER
  THE MONITOR BY TYPING": PRINT " CALL -151"
335 IF PEEK (0) THEN POKE 5634,0: POKE 5635,3
375 IF PEEK (0) THEN POKE 34050,0: POKE 34051,3
```

3. Type `SAVE CHECKIT.HP`

Now, to enter a program using HexPad and Checkit on an Apple IIGS, type `RUN CHECKIT.HP`. HexPad will be installed automatically. Remember, you still have to enter Open-Apple-H or Open-Apple-D to switch HexPad out of normal mode.

If you enter a hexadecimal file with a starting address below \$400, HexPad will be disconnected. This prevents HexPad from being overwritten while it is active (which would cause `BASIC.SYSTEM` to crash).

While using `CHECKIT.HP`, do not type `IN#A$300` (or any `IN#...` command). This will disconnect the Checkit input routines.

HOW THE PROGRAM WORKS

HexPad performs its keypad remapping by intercepting all keyboard input. If the key that was pressed is to be remapped, HexPad returns the remapped character rather than the actual keypress.

Lines 33-95 contain the installation code for HexPad, while the main code is contained in lines 100-206.

When keyboard input is requested by a program, control is transferred (via the `BASIC.SYSTEM` I/O routines) to line 102. The subroutine `GETKEY` (lines 202-206) is then executed. This routine first checks to see if `BASIC.SYSTEM` is using the 80-column firmware for output. If so, the firmware routine `BASICIN` is used to read a keypress. If not, the Monitor routine `KEYIN` is called.

After a keypress has been obtained, the keypad bit in the keyboard modifier register (see Table 3) is checked. If the keypress was in the keypad, then control passes to `KEYPAD` at line 137, where any necessary remapping takes place.

Table 3: Keyboard Modifier Register \$C025

Bit	Value	Description
7	0	Open-Apple key not pressed
	1	Open-Apple key pressed
6	0	Closed-Apple (option) key not pressed
	1	Closed-Apple (option) key pressed
5	0	No update since last keypress
	1	Modifier register has been changed since last keypress
4	0	Keypad key not pressed
	1	Keypad key pressed
3	0	Autorepeat inactive
	1	Autorepeat active
2	0	Caps lock inactive
	1	Caps lock active
1	0	Control key not pressed
	1	Control key pressed
0	0	Shift key not pressed
	1	Shift key pressed

If a keypad key was not pressed, the Open-Apple key is checked in line 111. If it was pressed, `CHKCMD` at line 118 is executed. This routine checks for any command characters, and takes appropriate action.

MODIFICATIONS

One possible modification to HexPad would be the addition of new modes. In addition, more remapping could take place while in decimal mode.

When making changes to HexPad, be sure that the end of the program does not exceed \$3CF, since the area at \$3D0 and above is reserved. If your program becomes too long, you may have to change the `ORG` address.

Two Minute Apple Programs!

They're unique! They're quick. They're easy. And they'll give you hours of enjoyment.

Got a Minute?

It only takes a minute or two... and you'll have your Apple II doing incredible things. Play a quick game of *Mini Break Out*. Or *Melt Down* your text screen. Entertain yourself with the wriggling graphic antics of *Worm*. Or spin your cursor like a cheerleader with *Twirler*.

Nearly 200 Selections

And that's just the beginning. With nearly 200 of *Nibble's* best One- and Two-Liner programs to choose from, you can't go wrong. Use *SuperFinder* to locate any hex string in memory. You won't believe how easy it is to sort things out until you try the two-line *Alpha Sort* program. And many of these quickies are powerful add-ons to your own program projects.

Utilities Galore

Try *Low-High Convert* to create hi-resolution versions of your Lo-Res graphic screens for printing. Or use *Free Space* to find out how much room is left on your ProDOS volume. *Amper Input* accepts those nasty commas and colons without missing a beat. Or become a Lo-Res artist with *Mini-Draw*, and paint in 16 colors to your heart's content.

ALL NEW

In addition to the best of *Nibble*, this one-of-a-kind volume contains dozens of brand new programs — never before published. With games, utilities, graphics, music, and arcade action, there's something for everybody! You'll be amazed at the power that's packed into each of these snappy winners.

You Get A Disk TOO!

If you'd rather be using than typing these little gems, you can slip the disk collection — nearly 200 in all — into your Apple II system and begin running them right away. Then when you see a program you really like, you can examine the programming techniques and learn to use them yourself!

PROGRAMS FROM RECENT ISSUES

Nibble software is inexpensive and easy to use. Each disk contains the major programs from the magazine issue noted. You'll learn a lot about your Apple II and have fun doing it. To place your order:

- Use the handy tear-out order card in this issue to order software, books, and magazine subscriptions or
- Call toll-free 1-800-888-1660 for fastest service. Have your MasterCard or VISA handy and call between 9:00 a.m. and 5:00 p.m. Eastern Time.

HURRY! THESE SPECIAL INTRODUCTORY PRICES ARE IN EFFECT FOR A LIMITED TIME - ORDER NOW

■ **JUNE 1990 DISK** — Memory Master/Odometer/Font Conversion Utility/Poking Dynamic Displays... Volume 11, Issue #6.

Order No.: **W32**... Introductory price of \$12.95 expires 8/31/90. (New price will be \$16.95.)

■ **MAY 1990 DISK** — Directory Designer/Print Shop Graphic Browser/HyperRes Plus... Volume 11, Issue #5.

Order No.: **W31**... Introductory price of \$12.95 expires 7/31/90. (New price will be \$16.95.)

■ **APRIL 1990 DISK** — Sound Wizard/Solving Simultaneous Equations/ProDOS Linker... Volume 11, Issue #4.

Order No.: **W30**... Introductory price of \$12.95 expires 6/30/90. (New price will be \$16.95.)

■ **MARCH 1990 DISK** — ProDOS Disk Doctor/Bicycle Log/Custom Bingo... Volume 11, Issue #3.

Order No.: **W29**... Introductory price of \$12.95 expires 5/31/90. (New price will be \$16.95.)

For a 90-day period following the publication of each issue, *Nibble* offers the major programs from that issue on disk at nominal "introductory prices."

During the introduction period, products will be shipped without accompanying documentation under the assumption that the buyer has the issue in which the programs appeared. Following the introduction period, the programs will be accompanied by reprints of the *Nibble* articles that documented them.

OUR GUARANTEE

Nibble software is guaranteed to perform as advertised. If you are dissatisfied for any reason, simply return the disk, documentation and invoice to us within 45 days of purchase. We'll refund the full purchase price.

MAY 1990 DISK

■ **Directory Designer** lets you arrange the filenames in any ProDOS directory to make life easier. You can group files by frequency of use, the program that created them, or any other criteria you desire.

■ **Print Shop Graphic Browser** shows you all the Print Shop graphics pictures on a disk. You can view four pictures at a time, and zoom through all the filenames to find the ones to view next.

■ **HyperRes Plus** doubles the resolution of the Apple II's Hi-Res screen. Refine your displays with a resolution of 560 dots across the screen. Simple commands are available from Applesoft.

Order No.: **W31**... Introductory price of \$12.95 expires 7/31/90. (New price will be \$16.95.)

APRIL 1990 DISK

■ **Sound Wizard** lets you make beautiful sounds on your Apple II — or, if you prefer, you can take a walk through the wild side of buzzers and flying saucers. Powerful yet easy-to-use commands give you full control over your Apple's speaker.

■ **Solving Simultaneous Equations** crunches numbers galore. This AppleWorks template solves up to four algebraic simultaneous equations.

■ **ProDOS Linker** adds DOS 3.3 compatibility to ProDOS. You'll be able to catalog DOS 3.3 disks from ProDOS and, when you find the file you need, you can load it without using an external program.

Order No.: **W30**... Introductory price of \$12.95 expires 6/30/90. (New price will be \$16.95.)

MARCH 1990 DISK

■ **ProDOS Disk Doctor** helps you cure ailing disks. You can examine the bytes on a disk in detail, and change any of them using hexadecimal or alphanumeric style. Works on all sizes of ProDOS devices.

■ **Bicycle Log** computes your average pedaling speed after you enter the facts about your latest bike trip. This AppleWorks spreadsheet shows your progress by the length of trips.

■ **Custom Bingo** prints out specialized bingo cards on any subject for which you supply the questions and answers. A great twist on the normal drill and practice.

Order No.: **W29**... Introductory price of \$12.95 expires 5/31/90. (New price will be \$16.95.)

FEBRUARY 1990 DISK

■ **Real Estate Advisor** gives you the numbers you need to decide if you should continue renting or take the plunge into home ownership. It figures long- and short-term costs, loan payments, and tax benefits.

■ **Stranded** puts you on a desert island where the only other inhabitant is your worst enemy! Both of you have anti-matter bombs, and only one will survive.

■ **GS Alarm** will help you from missing important appointments while using Applesoft BASIC. Set the time and the message, and let your mind concentrate on your work instead of a clock.

Order No.: **W28**... Introductory price of \$12.95 expires 4/30/90. (New price will be \$16.95.)

JANUARY 1990 DISK

■ **Line Manager** will spare you from the pain of renumbering Applesoft programs. This ampersand utility uses the auxiliary memory to carry out the process instantly; just enter the first line number of your program, the line-number

increment you prefer, and voila! Line Manager keeps your original program in memory until the new one is created. And if it encounters an error, it leaves your program untouched.

■ **Over the Rainbow** is a very special place. You can see a spectrum in the sky only under certain environmental, atmospheric, and physical conditions. This program, which simulates light rays passing through a drop of water, will help you learn when rainbows are most likely to occur.

■ **ASCII File Reader II** continues the exploration of GS/OS programming by Sandy Mossberg. Learn to create an application window, draw text within it, and dump the screen to the printer.

Order No.: **W27**...\$16.95 + shipping

DECEMBER 1989 DISK

■ **Treasure Dive** will tantalize the daredevil in you. Chests full of loot lie beneath the waves, but you have to outsmart piranhas, sharks, and deadly ocean mines to reach them. This original, arcade-style game, written in assembly language, will surprise you with its rich sound effects, humorous graphics, and non-stop action. The program has multiple skill levels, and keeps a file of your 10 best scores.

■ **Free Space**, a New Desk Accessory for the IIGS, will see to it you never again play guessing games when saving a file. Just pull down the Apple menu, select Free Space, and you'll get an instant report containing the name of each volume (including RAM disks), its capacity, and unused space in kilobytes. Free Space is an assembly-language program, and uses macros to invoke IIGS toolbox routines.

■ **Ticket Kit** will put a nice touch on your next fund-raiser, whether it is a raffle, talent show, or car wash. Just enter the particulars — the event, place, date, time, and price — and this program will design and print as many tickets as you need on an ImageWriter printer. Ticket Kit works with other printers after a few easy modifications.

■ **Hex File Checker** is a machine-language lifesaver. Use it, and you'll no longer have to check machine-language programs byte by byte to find the typo that slipped by. Just enter the starting address of the program you want checked, and this utility will step through it eight bytes at a time so you can compare the code to the listing.

Order No.: **W26**...\$16.95 + shipping

NOVEMBER 1989 DISK

■ **Nibble Assembler** is your best alternative to an expensive, commercial assembler. All you need to type in assembly-language programs and routines is this application, a ProDOS-based word processor, an Apple with 128K of memory or more, and a listing.

■ **Trinum**, a Hi-Res game for two or three players, will stretch your advance-strategy skills. You've heard of a love triangle; now play this logic triangle, based on the game TriNim, but intricate and challenging, a rival for Othello and other computer "board" games.

■ **Search Sampler** will show you the difference a binary search can make. Applesoft pro-

grams that employ linear searches on large data sets can creep along like cold syrup. This program generates random-number arrays, then uses them to demonstrate the greater efficiency of the binary search.

■ **ASCII File Reader** is Part 1 of Sandy Mossberg's exploration of a GS/OS Desktop application. This installment deals with the core elements shared by Desktop applications.

Order No.: **W25**...\$16.95 + shipping

OCTOBER 1989 DISK

■ **Widgets** will challenge your business savvy. You're the president of the company, and your decisions about pricing, wages, advertising, research and development will determine its success or bankruptcy. Widgets combines the fun of a computer game with the lessons of running a small business. The result is an enlightening experience.

■ **GS Startup Screens** will soften the long delay. All you need are these two short programs, and a Super Hi-Res picture of your own creation or choosing. Once you've installed the art — a title screen, perhaps — you'll never have to worry about it again. Every time you boot the disk, your IIGS will display it automatically.

■ **Video/Movie Database** will help you find that certain videotape, even if you don't know its title. Search by actors/actresses, category, year, or director. Video/Movie Database is an AppleWorks application, so you need not be an expert programmer to build it.

■ **Getting the Little Picture** displays a colorful, flying rocket on the Hi-Res screen, but it is capable of much more. Use it to explore the world of Apple II graphics.

Order No.: **W24**...\$16.95 + shipping.

SEPTEMBER 1989 DISK

■ **DB Construction Kit** simplifies the database creation process. No longer do you have to be a programming genius to build a database dedicated to your task, one that will work more quickly and efficiently than a general-purpose, commercial program.

■ **Wordsearch Wizard** makes building those brainteasers almost as fun as solving them. Just enter in the words you want to "hide," edit them as necessary, and press the Return key. Title the result, and a printout is just another keystroke away.

■ **Appleworks Gradesheet** can be a teacher's (next) best friend. It can manage student records according to name or test score. It can also help you monitor student progress, generate forms for grade entry, and keep track as students come and go.

Order No.: **W23**...\$16.95 + shipping

AUGUST 1989 DISK

■ **Nibble Number Cruncher**, a powerful, stack-based calculator, performs everything from simple addition to complex statistical and trigonometric functions. Watch it send your work to the printer for an organized, uncluttered printout.

■ **PFX** takes the tedium out of handling ProDOS prefixes. Stop typing in those long pathnames and let this tool select the prefix with just a few keystrokes. It can be used from immediate and deferred modes.

■ **Mr. Clean** makes dirty disk drives a distant memory. Use the simple installer to add the CLEAN command to ProDOS. Insert your cleaning diskette, type CLEAN and presto! No more endless CATALOGing.

Order No.: **W22**...\$16.95 + shipping.

JULY 1989 DISK

■ **Nibble MenuPro** gives you total control of all your files and directories, enabling you to exercise standard commands from one menu.

■ **Magic Squares** adds a little spark to a mysterious mathematical configuration. Create huge, odd squares with a few simple commands, then use them for games and educational programming.

■ **SuperClock** lets you know the time and date, any time, accessible from any IIGS program.

■ **New Desk Accessories in the GS/OS Environment** explains the essentials of IIGS NDAs, with instructions on building your own System Devices NDA.

Order No.: **W21**...\$16.95 + shipping

SOFTWARE DIRECTORY

Browse through our Software Catalog and see how easy, fun and inexpensive buying software can be!

Whether you want to organize your home finances, draw splashy graphics, play games, or improve your programming efficiency, you'll find a Nibble Software disk that meets your needs.

We offer practical software that works quickly and easily. And we offer it at a low price! Chances are, you won't find this value elsewhere.

Nibble diskettes are not copy-protected. They come with copies of the original articles that show not only how to use them, but also how they work. It's a great way to learn programming techniques for customizing or writing your own programs.

And because we understand that Apple users don't upgrade every year, all Nibble programs run on the II Plus, IIe, IIc, IIc Plus, and IIGS unless otherwise noted. Many programs are in DOS 3.3 format and can easily be converted to ProDOS. All disks are 5.25 inches unless otherwise noted.

Dear Nibble,
One of the best features
of your magazine is the
Nibble Software section.
The sheer volume of
programs on a single disk
for a ridiculously low price
astounds me.
How do you do it?

Sincerely,
R. Sweeney
McFarland, WI

**Now, turn the page
for some easy shopping...**

Here are two easy ways to order Nibble Software:

1. Call toll-free 1-800-888-1660 for fastest service. Have your MasterCard or VISA handy, along with the software order numbers and the names of the software you want. Ordering hours: 9:00 am-5:00 pm Eastern Time.
2. Or tear out and mail the Products Order Card you'll find in this issue to order software, disk subscriptions, books and magazine subscriptions.

OUR GUARANTEE

Nibble software is guaranteed to perform as advertised. If you are dissatisfied for any reason, simply return the disk, documentation and invoice to us within 45 days of purchase. We'll refund the full purchase price.

PERSONAL FINANCE

INVESTMENT ANALYST

■ **The Broker** tracks the performance of your investments and graphically depicts the results, showing the relative profitability of your activities. Easy data entry and a variety of report options make this one of our most popular financial programs for investment recordkeeping.

■ **Nibble Investment Adviser** calculates return on investment both before and after taxes and for various time periods. You can measure the "bottom line" performance of up to 96 different investments, keep track of dividends and other income.

■ **Stock Analyst** develops a history of individual stocks, updates and tracks their performance, then evaluates each investment or the entire portfolio — automatically. Determine the value, amount of return, and your profit or loss if you were to liquidate the portfolio today.

Order No. **F02** Investment Analyst . . . \$26.95

SMALL BUSINESS TOOLS

■ **The Forms Shop** creates customized letterhead, business forms and stationery in a variety of typestyles. (Requires a printer.)

■ **AppleWorks Plot** adds a Hi-Res plotter to AppleWorks. Print out a graph of spreadsheet or database data, or save it to disk.

■ **AppleWorks Bar Charts** lets you create bar charts from AppleWorks data.

■ **Quick Calendar** prints a full year's calendar on one page.

Order No. **F07** Small Business Tools . . . \$19.95

SHOPPER

■ **Super Shopper** maintains a master list of up to 1,600 separate items and lets you print out custom shopping lists for each trip to the grocer. Organize items into categories by product type or according to the aisles in your favorite store. (Requires a printer.)

■ **Coupon** keeps track of money-saving grocery coupons, so you maximize your household budget. Coupon lets you organize your coupons, weed out expired ones, and search and sort the coupons you want to take to the supermarket.

■ **Recipe Box** lets you keep your favorite recipes on disk and easily retrieve, edit, display and print out copies for a friend. Planning

a party or dining alone? Recipe Box automatically determines the ingredient quantities needed for any number of guests. Your Apple can't do the

PERSONAL INVESTOR

■ **The Investor** is a best-seller with five different reports including market, sales and yield analyses. Powerful Hi-Res graphs depict short-term and long-term price and market trends for each stock. Invaluable for deciding on sells/buys or for assembling information for tax reporting.

■ **Price File Editor** makes your investment analysis even more efficient. Records can be sorted, deleted or quickly added to the Investor's price files.

Order No. **F01** Personal Investor . . . \$29.95

MANAGING MONEY

■ **Portfolio** turns your Apple into a personal stock analyst. It generates stock sell signals, tracks price updates, and records all your transactions. You can display up to four purchases of the same stock, track short sales, and review the last 10 turning points in a stock's price to compare the results of different investments.

■ **Financial Calculator** helps you make nuts-and-bolts financial decisions by instantly calculating interest on loans, future fund accounts, money markets, and scheduled deposit accounts. A valuable aid when you go shopping for loans or interest-producing investments. Requires a IIc, IIgs or an 80-column Iie.

■ **Investment Calculator** picks up where spreadsheets leave off. It calculates a variety of internal rates of return, net present value, and net future value of your investments. Find out which investments produce the best return for your cash investment.

Order No. **F08** Managing Money . . . \$19.95

HOME FINANCE MANAGER

■ **TRAC** (Trend Reporting, Analysis and Control) monitors your credit card, check and cash expenditures. It prints more than 10 different

useful reports for analyzing your spending and managing your budget. Discover just where your money slips away — and start saving!

■ **TRAC Budget** is a flexible, fast budget preparation and reporting system. It allows you to easily prepare a personal budget, then prints reports that compare your budget to actual expenditures on an ongoing basis.

■ **TRAC Income** adds a third major module to the system. It generates monthly income statements and year-to-date reports.

■ **TRAC Graph** plots your personal finances in Hi-Res graphics for quick, visual analysis.

Order No. **F03** Home Finance Manager \$19.95

MONEY SAVERS

■ **Nibble Banker** records and codes checking transactions, helps balance your checkbook and prints out expense reports for the categories you specify.

■ **Nibble Decisionmaker** evaluates alternative buying decisions down to the penny. So you spend your money more wisely.

■ **Loan Payback** instantly calculates the monthly payments on a loan for various principal amounts and interest rates. Requires IIc or Iie with auxiliary 80-column card.

Order No. **F06** Money Savers . . . \$24.95

cooking for you, but it will save you a lot of time in the kitchen.

Order No. **H01** Shopper . . . \$22.95

NEW!

NIBBLEWRITER

■ **NibbleWriter** is an easy-to-use 40-column word processor. It is screen oriented and includes a full function word wrap, insert and delete functions, and many more useful features.

■ **PrintWorks** lets you use proportional printing in multiple fonts on your Hi-Res screen. Dress up your Applesoft programs with fancy output. A font editor is included so you can create your own proportional fonts.

■ **Print Studio** enhances your ImageWriter by letting you create your own custom characters. You can include not only letters and numbers but also special symbols, and mix your new font with the ImageWriter's built-in fonts.

Order No. H14 NibbleWriter\$19.95

CAR AND TRAVEL PACK

■ **Gas Miser** is a thrifty program that tracks gas consumption for selected time intervals or for an entire year, and then plots the results in Hi-Res graphics. Even better, Gas Miser can be easily modified to measure your use of electricity, food or any other household expense. (Requires a printer.)

■ **Apple Highways** finds the best route for your next road trip. It can plan your route, list intermediate cities and highway numbers, and then automatically calculate the mileage for each leg of the journey. You can add to the 170 major US cities included on the disk. Get ready to go!

■ **Nibble Garage** makes preventive maintenance a snap! You just need your owner's manual, and some idea of the date and odometer reading each time your car is serviced. Then relax and let Nibble Garage generate the repair reminders that keep your car running smoothly.

■ **Expense Calc** gives you a quick and accurate picture of your business travel expenditures. This easy-to-use spreadsheet program neatly formats and prints weekly expenses. It can be easily adapted for personal as well as business expenditures.

Order No. H06 Car and Travel Pack . \$22.95

NEW!

NIBBLE HOME OFFICE

■ **QuickWriter** emulates an electronic typewriter, for those small typing jobs that should be finished before your word processor finishes loading. This full-featured program allows you to save your work, too.

■ **NibbleCalc** offers you a powerful beginner's spreadsheet. Now it's easy to calculate your budget or to work out your taxes!

■ **Poster Creator** allows you to turn your Hi-Res and Double Hi-Res art into huge posters. With it you can blow up your charts and graphics so they can be seen from across the room. A typical poster can consist of up to 12 sheets of 8.5-11-inch paper for a normal Hi-Res picture or 24 sheets for a Double Hi-Res creation.

■ **AppleWorks Automated Check Register** lets you organize your check spending wisely and thoroughly.

Order No. H13 Nibble Home Office . \$22.95

NEW!

HOME MANAGER

■ **Message Center** turns your Apple II into a household bulletin board. Improve communications in your busy home or office, and keep everyone up-to-date on important events. Display messages at certain times, or leave private messages to special people.

HOME ARCHITECT

■ **Nibble Architect** uses the principles behind professional computer-aided design systems, to let you develop floor plans with ease and flexibility. Create, modify, and manipulate up to 50 items per room (including doors and windows) while maintaining accuracy to the nearest inch. Objects can be drawn to scale, and then moved, changed and duplicated — all in Hi-Res graphics that help you easily visualize different layouts. After planning your room design, print the layout and save it on disk for future reference!

■ **The Shape** allows you to create, view, edit and save graphics shape tables. Free-form shapes created in Lo-Res graphics are automatically translated into Hi-Res shape tables that can be used in any Applesoft or assembly

language program. Have fun jazzing up your own programs with your own graphics. Requires Apple II Plus and IIe only.

Order No. H07 Home Architect \$29.95

■ **Energy Squeezer** can help you take the heat off your utility bill. Discover how your home uses energy and learn where you can save. Spreadsheet-style data entry makes this program a snap to use.

■ **NibbleTerm** connects you to the Apple II online community. This telecommunications program works with your modem to hook you up to other Apples and network services too.

■ **Bill Keeper** helps you organize and chart all your monthly expenses. With this menu-driven household bookkeeper you can track expenses for up to 40 different accounts and add up monthly and yearly totals.

Order No. H16 Home Manager \$26.95

NEW!

APPLEWORKS ASSISTANT

■ **Proof** allows you to examine what AppleWorks stores in each spreadsheet cell. This program is a valuable debugging and documentation tool for your AppleWorks spreadsheet files.

■ **Works Processor** quickly creates text files from your AppleWorks word processing documents, with or without carriage returns.

■ **ChartWorks** is an AppleWorks graphics utility that allows you to display and graph your spreadsheet files. You can read in files, display them, designate rows and columns of the spreadsheet as arrays, and graph that data in a number of different ways.

■ **NewsMaker** takes text files from AppleWorks or any other word processor and prints them out in two columns. Reduce pasteup chores when using The Newsroom or Print Shop by preformatting your work.

Order No. H15 AppleWorks Assistant \$22.95

FREE TIME

■ **Garden Planner** is a fantastic graphics program for designing your garden row-by-row, calculating costs, and projecting the harvest from

your efforts. Shift and change your garden layout until it's just right — a planting guide tells you everything you need to know about 45 common vegetables.

■ **Outliner** is a valuable idea processor that helps organize your thoughts in an outline format. It features pull down menus and cut-and-paste editing. Great for planning your time, outlining projects, writing reports, and anything else you can think of.

■ **Tape Library** solves the mystery of what's where in your audio or video tape library. This handy database keeps track of what you've recorded so you can quickly find selections, or find the open space for recording that favorite show that's on tonight.

■ **Jogger** is like having a coach-in-residence. It tracks your daily running progress and puts monthly mileage goals within your reach. It can be easily modified for other sports like swimming and bicycling. Jogger lets you spend less time tracking your sport and more time doing it.

Order No. H12 Free Time \$22.95

MAIL MANAGER

■ **AIM (Automated Intelligent Mailing)** manages your mailings with ease. Because AIM lets you define up to 32 fields of information in each record, you can customize your lists to include exactly the information you need. After defining the format, you can display the data, make any changes, delete, find, sort, and print the labels. An "assembling" feature even lets you select the fields you want to print out on the label.

■ **Postmaster** lets you create records for up to 100 labels, save them on disk, then print them out in a variety of styles. Postmaster is especially handy for any situation where you want to file and print a variety of freely formatted labels. Printing mailing labels has never been easier! (Requires a printer.)

Order No. H05 Mail Manager \$22.95

CALENDAR LIBRARY

■ **Nibble Desk Calendar** is a quick-reference desk calendar that lets you highlight dates and print out a list of the corresponding events. Menu bar selection makes entering, changing or deleting events a snap!

■ **Personal Appointment Calendar** keeps track of a year's worth of appointments with fast editing and printing.

■ **Quick Calendar** prints a full year's calendar on a single page. You'll never need to buy a calendar again!

Order No. **H08** Calendar Library . . . \$16.95

DIETER

■ **Diner** is a personal diet planner that not only provides you with a nutritional analysis of foods and entire recipes, but also helps you keep track of your eating habits. The disk includes a database of over 400 foods, showing vitamin, mineral,

protein, cholesterol, fat and calorie content. Now you can customize your menu planning to match your body type, and develop both long-term and short-term diet planning. Users have told us that Diner out-performs other similar programs costing many times its price.

■ **Calorie Counter** tallies your calorie consumption with the calorie contents of the foods you eat. You assign calorie data to breakfast, lunch, dinner or snack categories and an automatic warning is flashed when you go over your daily limit!

■ **Fat Graph** tracks your dieting progress by

plotting weight changes in glowing Hi-Res color. Just enter your weight every day; Fat Graph will plot it over time (for up to 120 days), and display your progress.

■ **Recipe Box** makes cooking simple by keeping your favorite recipes on disk. Planning a party or dining alone? Use Recipe Box to automatically determine the ingredient quantities needed for any number of guests. You can even include notes to remember which recipes were hits!

Order No. **H02** Dieter . . . \$26.95

SOUND MAKER

■ **Sound Synthesizer** creates sounds ranging from a complete musical score to explosions, machine guns and even bird calls. This sound creation utility lets you "draw" your sound effects on the screen in Hi-Res graphics. All sound effects can be saved on disk and replayed with a single command or stored in libraries for later use in your own Applesoft or machine language programs.

■ **Nibble Duet** jazzes up your programs with synthesized two-voice sounds. Create sophisticated sound effects to complement your visual effects. A demonstration program shows you how to vary them and add sounds to your programs.

■ **Apple Talker** turns your Apple into a digital recorder. Sounds and words prerecorded on tape are played into the Apple via the cassette input, sampled and stored in memory and on disk. You can add speech to your programs without purchasing any expensive hardware. (Not compatible with the IIc or IIGS.)

■ **Beep Customizer** lets you modify your Apple's beep and includes the changes in other DOS 3.3 programs.

Order No. **S02** Sound Maker . . . \$19.95

MUSIC MAKER

If you've tried incorporating music into your programs, spent hours fiddling with POKes and

CALLS, and still haven't gotten the musical notes you want, then try Music Maker — before you break your baton.

■ **Tunes** is an easy-to-use music system designed for quickly entering any tune into your Applesoft program. Play any note in a four octave range, with a duration as short as a quick click or as long as six continuous minutes! With a little extra effort, you can create songs and snazzy sound effects. Sharps, flats, duration, staccato, pauses, and all of the other piano/organ effects are there at your fingertips.

■ **Nibble Maestro** transforms your Apple keyboard into a four-octave organ. As you touch the keys, your Apple plays the corresponding notes and they simultaneously appear in the staff on the screen. Songs may be stored on disk where they can be edited or replayed. Use all 49 notes to compose tunes with Nibble Maestro.

■ **Little Organ Apple** is a Hi-Res representation of a two-octave organ keyboard that you can really play! This instrument can be used by

anyone for entertainment, by musicians for experimentation, and by students for practice.

■ **Happy Birthday** plays the "Happy Birthday" song and displays the words complete with the birthday person's name. Perfect for your youngster's next birthday.

■ **Guitar Chord Tutor** draws the first six frets of a guitar, and then uses Lo-Res graphics to overlay the proper finger placement. All basic major, minor and seventh chords are available. There's even a special feature that lets you measure your progress.

Order No. **S01** Music Maker . . . \$22.95

GRAPHIC LIBRARIAN

■ **Shape Librarian** lets you more easily work with Hi-Res shapes. This powerful utility helps you combine tables, delete shapes, insert shapes, and more.

■ **Getting the Big Picture** compresses Hi-Res graphics to 25 to 50 percent of the space required by normal pictures. Whether you're designing graphics for an arcade game or for business presentation software, you will find this program invaluable.

■ **Mousetrap** takes your Hi-Res graphic and stores it in Print Shop format. Use the mouse or keyboard to capture any part of the Hi-Res screen.

Order No. **A12** Graphic Librarian . . . \$18.95

DATABASE LIBRARY

■ **Executive Card File** puts an electronic index card file at your fingertips. You'll get tremendous flexibility with easy data entry and editing, speedy sorting and disk-based storage. Data can be entered and organized in virtually any manner. Each "card file" may contain up to seven sections and as many as 35 index cards can be stored in each section. Each card can hold nearly 500 characters. Once filed, index cards can be displayed, edited, sorted, removed or printed to a printer.

■ **Nibble File Cabinet** can be used to keep track of household or business information such as names and addresses, home inventory and everything else. Information stored in your File

Cabinet can easily be modified, rearranged or displayed. Nibble File Cabinet includes variable length records with key sorts and binary tree data storage. A Nibble best-seller!

■ **Applesoft Record Command System (ARC)** is a comprehensive information management program. Features include advanced data filing, editing, printing and telephone dialing. Search records, merge files and send data to your printer. And since your entire data set is stored in memory, ARC is fast.

Order No. **H10** Database Library . . \$24.95

GRAPHICS PROGRAMMER

■ **Hi-Res Houdini** performs Hi-Res magic on your Applesoft or assembly language programs. Use machine language utility to create special graphic effects: scrolling and shifting images, changing shape colors, inverting Hi-Res colors, and merging, copying and swapping pictures on both screens. The graphics are amazing, and it's magically easy to use.

■ **Hi-Res Fill-Reverse** adds pizzazz to your Hi-Res graphic displays. Specify any rectangle and fill it with the color you select. Then use Reverse to create an explosion or produce other spectacular effects.

■ **Graphics Toolbox** is all you need to create dynamic animations. You'll have fun watching the effects produced by switching Hi-Res pages, inverting the images, and superimposing the page 2 image on page 1. A super tool for creating special effects.

■ **Amper DHR** taps your Apple's Double Hi-Res capabilities so you can produce sharper, more realistic graphics. Use special commands in your Applesoft programs to simulate normal Hi-Res commands. You get twice the normal horizontal graphics resolution on your Apple. (Requires at least 128K of RAM; not compatible with the Apple II Plus.)

■ **Eye Openers** makes a dramatic transition from one Hi-Res picture to another with an opening iris effect. An ever-widening hole appears in the center of the old image, revealing the new image. Add excitement to your own Applesoft graphics shows!

Order No. **A05** Graphics Programmer \$18.95

PRESENTATION LIBRARY

■ **Chart Manager** transforms numeric data into sophisticated graphics. This versatile program performs basic statistical analyses, sorts and edits data, produces linear regressions, and then transforms the data into Hi-Res scatter plots, pie charts and bar graphs. Perfect for sales analyses and forecasting, personal finance evaluations, and investment analysis!

■ **Banner Boss** creates custom, eye-catching banners for parties, promotions — or any special occasion. Messages can be up to 255 characters long, written in letters two or five inches high, with underlining and emphasized print to add a personal touch. Say it with banners! (Requires a printer.)

■ **Color Billboard** turns your Apple into a dynamic electronic billboard for displaying attention-getting messages in 15 different colors. Features include smooth, fast text scrolling and colored blinking lights. Great for leaving messages for the family, or for math or language flashcards in school, or for advertising messages in your store.

■ **Solid State Slide Show** stores Hi-Res pictures and displays them with the speed of a slide show. You can store up to 18 different pictures to be used in your presentation. Use it for games or as an attention-getter in a store or trade show. (Requires at least 64K of RAM.)

Order No. **A04** Presentation Library \$19.95

WINDOWWORKS

■ **WindoWorks** produces up to 50 dazzling animated windows with seven different types of animation that include: four-way scrolling, flashing regions, changing colors, and flashing window frames. Make text flash, curve, and dash across the screen for great displays.

■ **Ultra Fast Plx** saves and loads Hi-Res screens at lightning speed. You can scan and display 17 pictures on disk in less than 10 seconds. Snazzy promotional tool. Requires II Plus, IIc, IIe and a 5.25-inch disk drive.

■ **Text Sculpture** turns ordinary text into almost any shape you can fit on the printed page — with a standard printer. Draw profile faces, decorative designs, and anything you can imagine.

■ **Wipeouts** gives you 10 novel ways to clear screens: top-to-bottom, bottom-to-top, left-to-right, right-to-left, or even fan outs from the center of the screen.

Order No. **A09** WindoWorks \$19.95

DESIGNER/ILLUSTRATOR

■ **Designer and Illustrator** let you create complex graphics for gardening/landscaping, title displays, games development, or circuit/pipe layouts the easy way! Use the Illustrator to create graphics shapes; use the Designer to combine the shapes in your graphics library to build complex, professional displays. You can scale, color, edit, rotate and even redraw your shapes in "medium resolution" graphics. Make things look the way you want them to look — and have fun doing it too!

■ **The Shape** takes advantage of the Apple's powerful graphics capability. It allows you to create, view, edit and save shape tables. The free-form shapes created in Lo-Res graphics are automatically translated into Hi-Res shape tables. Have fun jazzing up your own programs with graphics that you design.

Order No. **A02** Designer/Illustrator \$19.95

TURTLE LIBRARY

■ **Turtle BASIC** adds turtle graphics commands to Applesoft. You use 24 special key-words to direct the "turtle" around the screen, print Hi-Res text, create animation and more. Turtle BASIC is fast. But watch out! Once your children learn the turtle, they may leave you in the dust.

■ **Apple Turtle Graphics** lets you use simple commands to move and turn the turtle, as it draws pictures on the screen. Turtle Graphics is an excellent tool for learning simple programming concepts, conceptualizing math concepts and geometry, or just creating nifty pictures.

■ **Turtle Tutor** is a demonstration library that shows you how to design your own pictures, combine them — even create 3-D effects.

Order No. **A01** Turtle Library \$22.95

ARTIST

■ **Apple Paint Box** is an electronic coloring book that combines the features of an Etch-A-Sketch, Spiro-Graph and a function-driven drawing board. Once you've drawn your shape, you can fill it with a flood of color.

■ **PAGE (Programmer's Aid for Graphics Entry)** lets you draw Hi-Res graphics, and then save them to disk as screen images or as program lines to include with your favorite Applesoft program. It also features a Help screen and options to draw, erase and change colors. At last! An alternative to shape tables.

■ **Art Gallery** is a Hi-Res video show of 33 different art forms, some accompanied by sound. Each art form has multiple variations and provides hours of entertainment. Just sit back and enjoy it.

■ **Hi-Res Shapemaker** is an easy-to-use program that enables you to draw boxes, lines or shapes, fill them in, and then frame the pictures. When it's finished, your masterpiece can be saved on disk.

■ **DHR Palette** lets you design Double Hi-Res graphics in black-and-white or color, and save the entire screen to disk for future fun. (Requires at least 128K of RAM; compatible with the unenhanced IIe only.)

Order No. **A03** Artist \$18.95

ART DIRECTOR

■ **Transformer** stretches the capabilities of your Hi-Res screen! Twist, stretch, and shrink any portion of the screen.

■ **Snapshot** prints out Hi-Res pictures vertically or horizontally on your ImageWriter.

■ **SpeedDraw** is an Applesoft tool that lets you create smooth curves and sharp angles on your Hi-Res screen. It takes care of all the trigonometry for you and all you have to do is learn SpeedDraw's ampersand commands.

■ **Fractal Trees** shows you how fractals, the exciting combination of mathematics and graphics, create the shape of nature. You can set up normal-looking fractal trees, or go for the alien and the bizarre!

Order No. **A11** Art Director \$19.95

SIGHT AND SOUND

■ **AmperPalette** is a powerful library of 22 ampersand commands that produce Double Hi-Res graphics in Applesoft. Use the special double-resolution 16-color mode or your IIe, IIc or IIGS, and even add music to your programs.

■ **Arcade Sound Editor** adds Zaps, Booms, and Kapowee's to your programs for real arcade excitement. This two-pitch sound creator produces a wide range of interesting and dramatic effects. Requires a II Plus or a IIe.

■ **HPLLOT GS** lets you create super Hi-Res graphics in 16 colors which can be changed to any of the 4096 colors available on the Apple IIGS. Define colors by specifying the red, green, blue concentration and then draw, plot and paint to your heart's content.

(continued)

■ **Hi-Res Tricks** adds 15 more routines to your graphics library for scrolling, mirror imaging, flipping, or even producing upside-down graphics screens. This utility gives your programs extra visual punch and it's a cinch to use.

Order No. **A10** Sight and Sound ... \$19.95

FONT FOUNDRY

■ **The Font Foundry** is a character generator and editor that you can use to design one-of-a-kind Hi-Res character sets. Make your documents print shop perfect!

■ **Double Hi-Res Characters** prints legends and captions in a variety of special character sets, including DOS Tool Kit format characters.

■ **Print Shop Utility** lets you capture an area from the Hi-Res screen and import it into Print Shop.

■ **Font Blaster** makes your Apple print like a Mac. It lets you use dozens of Tool Kit typefaces or create custom characters for the ImageWriter and Prowriter.

Order No. **A08** Font Foundry ... \$22.95

NEW!

IIGS GRAPHICS ASSISTANT

■ **Supergraphics GS** gives you the power to create stunning Super Hi-Res displays from BASIC. The 15 ampersand commands control the graphics screen from within your own Applesoft programs. Complete palette control lets you achieve dazzling effects.

■ **Super Hi-Res Picture Packer** compresses

and displays your collection of Apple IIGS Super Hi-Res Graphics. Store an art gallery on disk with the space this handy utility will save. You can also pack and unpack selected rectangular portions of the screen, to animate your own graphics!

■ **The Graphics Switcher** converts Super Hi-Res graphics to standard Hi-Res graphics. Enjoy IIGS art on any Apple II.

■ **GS/FX** provides you with three stunning new ways to look at graphics on the IIGS. You can present a black screen and watch your picture load in color by color. You can also fade your picture out to black or "fold down" the screen, color by color.

■ **Super Hi-Res Graphics Converter** brings all of your Hi-Res artwork to the Apple IIGS graphics screen, with many options for the type of display.

Note: 3.5-inch disk only.

Order No. **A13** IIGS Graphics Assistant \$29.95

CLASSROOM MANAGER

■ **Nibble Grade Book** gets high grades from teachers! It easily tracks and analyzes test scores, then calculates and prints the grades for up to 10 classes of 80 students each. This versatile program lets you store test grades and test descriptions, calculate cumulative grade points and percentage grades for each student. You can assign letter grades and determine the mean grade and standard deviation of a test. You can even drop the lowest test grades and adjust test scores for the entire class. An indispensable tool for all teachers!

■ **Personal Appointment Calendar** keeps track of up to 15 memos per day for a year's worth of appointments. And if you like to see everything in writing, just select and print out the appointments you need for quick reference.

■ **Executive Card File** puts an electronic index card file at your fingertips. You'll get tremendous flexibility with easy data entry and editing, speedy sorting and disk-based storage. Data can be entered and organized in virtually any manner. Each "card file" may contain up to seven sections and as many as 35 index cards can be stored in each section. Each card can hold nearly 500 characters. Once filed, index cards can be displayed, edited, sorted, removed or printed to a printer.

Order No. **E01** Classroom Manager \$26.95

Home/School Education

IT'S FUN TO LEARN

■ **Shark** is a graphics math game your kids will love. Save the fish from being gobbled up by solving math problems and get bonus points for speed. But expect problems to get more difficult as the game progresses. That's the challenge and the fun.

■ **Spelling Maze** takes a no-fail approach to teaching children to spell. Move the player through the graphic maze picking up letter-keys in the correct order to open the exit and escape. Music rewards your child's progress.

■ **Learn the USA** uses map graphics to help teach the location and capital of each of the 48 contiguous states. It tracks incorrect answers so you can measure your progress with each play.

■ **Keyboard Tutor** uses an on-screen graphics keyboard to provide home key instruction, key/finger drills, and accuracy tests for typing. It also includes an on-screen help and fast animation of finger-to-key visual aids. Outstanding typing aid.

Order No. **E14** It's Fun to Learn ... \$16.95

SCIENCE AND FUN

■ **Nibble Planetarium** has many of the features of a real planetarium. This Hi-Res star charting system displays the sky from any location in the Northern Hemisphere at any time of the year. A special mode lets you view the night sky and see how it changes with the passing hours. A great learning tool for amateur astronomers! *Bonus:* Includes a special unpublished file that includes all the major constellations — over 600 stars!

■ **The Serpent's Coil** traces the destructive paths of the hurricanes as they snake through the Gulf of Mexico and the Caribbean on a collision course with the U.S. coast. Track hurricanes on the Hi-Res screen, and the plot, scale, and label them for printing. Plot data for new storms, or track eight historic hurricanes, such as the Great Galveston Storm of 1900, Camille (1969), and Alicia (1983), that are included on the disk.

■ **Direction Fields** displays the intricate patterns of direction fields in Hi-Res graphics using the mathematical function you supply. Wind directions, patterns of iron filings in a magnetic field, and air flow patterns are just some of the phenomena you can investigate. For fun, you can also create fascinating abstract patterns.

Order No. **E08** Science & Fun ... \$29.95

MATHEMAGICIAN

■ **Math Monster** makes scary fun out of math learning. Can your children solve the multiplication or division problem before the Math Monster gobbles them up? That's the challenge — and the fun. When your child wins, the Professor runs across the screen and whacks the monster soundly. But, if they don't learn those multiplication and division facts, watch out! The Math Monster will eat them up!

■ **Math Marathon** is a math practice program that drills your children in addition, subtraction, multiplication and division. Varying levels of difficulty will help keep your kids in the running for good grades in math tests!

■ **Apple Trig** plots your favorite trigonometric functions in Hi-Res graphics. Watch the graph being plotted, and then overprint graphs to make comparisons. Apple Trig lets you graph the sine, cosine, tangent, cotangent, secant and cosecant functions. A great learning tool for home or school.

■ **Mathemagician** makes solving word problems magically easy. Your children's wits and math skills are their weapons in this exciting adventure game. They'll love solving the mathematical word problems to unlock doors, discover hidden treasure and escape lethal perils. It's fun to build math skills!

■ **Math Concentration** puts a new twist on an old theme. To win, your child must uncover matching colored pictures and solve math problems. Math Concentration facilitates memorization and the development of basic math skills — the fun way.

Order No. **E05** Mathemagician\$22.95

WORDS AND NUMBERS

■ **Flashcard** takes the drudgery out of math drill! Pace the speed of the drill to suit the learner: fast or slow, with one or two chances to give the correct answer. Flashcard plots a colored bar graph of successes and redisplay any problems that were missed. With Flashcard, kids can both enjoy using the Apple and learn their math tables.

■ **Universal Metric Converter** converts English and metric units with menu-driven ease. How many milliliters in a gallon? What's your weight in kilograms? Forget all those conversion factors, and let this program do the work for you!

■ **Trivia Master** never lets you run out of questions because it lets you make up your own. The quicker responses receive higher scores — if you're right. Because you can create and adjust the difficulty level of questions, Trivia Master can be challenging and entertaining for all ages. Trivia Master includes a file of 200 questions to get the party going.

■ **Word Find** lets you make your own hidden word puzzle mazes of any size up to 40 rows and 40 columns. Then print them out on your printer, with clues and a separate answer sheet. Fun for young and old. (Requires a printer.)

■ **Life** is a graphic version of the incredibly popular game of Life that was originally published in Scientific American. You set up a starting colony of cells and watch the birth, survival and

death patterns of the cells as generation after generation evolve, grow, migrate, move and behave in completely unpredictable patterns. A unique simulation.

■ **Binary Clock** is an amusing and unusual timepiece for the dedicated programmer. It displays an accurate machine language timepiece in Lo-Res graphics. Put aside your ordinary clock and view the current time as your Apple does — in 8-4-2-1 binary code!

Order No. **E04** Words and Numbers\$19.95

COMMANDER

■ **Nibble Beach Head** puts you in command. Destroy the enemy machine gun emplacement, while avoiding mortar attacks and machine gun fire. Each soldier is equipped with only a rifle and two grenades. However, the enemy has snipers, machine guns, mortar shells, barbed wire and mine fields. A must for war game and strategy fans.

■ **Tank Combat** simulates the deadly struggle of World War II tank combat. Strategy and foresight are the keys to winning, as you maneuver to defend your HQ, ammo dump and fuel depot against enemy fire. Use your six tanks wisely, or you won't survive the night.

■ **Artillery Duel** is a realistic artillery simulation with a twist of math. From opposite sides of a mountain, you shell your enemy's encampment. The best judge of fire power, barrel elevation, and a fickle wind will survive. This Hi-Res action will fascinate the math buffs.

■ **Atlantic Convoy** pits your navy against the enemy in an all-out struggle for the Atlantic. You need strategy and skill to maneuver your fleet of carriers, destroyers, submarines, and support vessels. Each type of vessel has unique attack, defense, and movement capabilities. Can you defeat the enemy before you run out of fuel or get sunk? Great entertainment on the Hi-Res seas!

Order No. **G05** Commander\$19.95

GHOST GOBLER

■ **The Nibbler** is the classic dot-gobbler: eat all of the dots in the maze while avoiding orange ghosts! Gobble the colored dots, munch on an energy cube for that extra boost of power, and keep progressing through mazes of increased difficulty. A feast of fun!

■ **Clam Bake** makes you the hapless, hungry

clam trapped in a kelp bed. To survive you must outmaneuver the deadly jellyfish, eat all the diatoms, and advance through the seaweed mazes. Four life-saving pearls are your only weapons. Clam Bake features stop/start options and optional sound effects.

■ **Speed Maze** challenges you to navigate a randomly generated maze as fast as you can. The wide range of selectable speeds makes the game fun for both novices and experienced players. And if you're a programmer, you'll find a fascinating algorithm for generating mazes.

Order No. **G10** Ghost Gobbler\$19.95

ATTACK PACK

■ **Surprise Attack** is one of the best arcade games we've published. It pits your skill and three defensive missile bases against an incoming horde of ICBM's. Your objective: the survival of six cities under your protection. Provides hours of white-knuckle challenge.

■ **Major Mayhem** puts you on a planet ruled by spiders. It challenges you to traverse a web of alien cities and collect enough energy spheres to refuel your ship and escape. But watch out, the spiders are coming!

■ **Barricade** is a two-player game of luck and strategy. Use a giant claw to demolish a wall of colored blocks. Grab the high-scoring blocks to win, but beware of mystery blocks. They can mean big gains — or big losses.

■ **Starlaser** puts you at the helm of a fast, laser-equipped starship. Battle the Kloryon starbases before your fuel supplies are exhausted. Be careful though. The Kloryons are notorious for making end run attacks from behind the meteor belt.

Order No. **G17** Attack Pack\$18.95

ELECTRIC ARCADE

■ **Formula Nibble** puts you behind the wheel of a Grand Prix race car taking the curves at top speed. Three super-realistic, full-color Hi-Res tracks simulate races on actual Grand Prix circuits. Start your engines!

■ **Voratio** is the hungry space worm. Guide it in search of food through your choice of 19 challenging levels.

■ **Othello and Seawolf** are two games: an ancient strategy game, and a simulation of torpedo warfare waged on the Hi-Res seas. (Requires paddles or joystick.)

Order No. **G14** Electric Arcade\$19.95

NEW!

NIBBLE GAME ROOM

■ **Chinese Checkers** brings an adaptation of the classic strategy game to your Apple. Play against a tough computer opponent on a colorful Hi-Res game board. Can you outwit your Apple and get your marbles across the board first?

■ **Connection** is a game that challenges you to compete against your Apple for territory on the

PRODOS LIBRARY 3

■ **Display** makes your ProDOS VAR files work for you! It looks into the VAR files on your disks, and lists the names and values of all real, integer and string variables in your Applesoft programs. An excellent tool for debugging; to efficiently initialize program variables; or to preserve the current state of a program while it carries out another task.

■ **Disk Librarian Pro** catalogs all your disks and instantly creates a quick-reference master list. Wondering which of a dozen disks holds the file you want now? Disk Librarian Pro has the answer! It reads and stores the catalog information, and records whether it's a DOS 3.3, Pro-DOS or Pascal disk. You can display, sort and print hundreds of file names. The master list can even be transferred into AppleWorks!

■ **Expanded ProDOS Catalog** displays all of the files on a ProDOS formatted disk — no matter how deeply they are buried in subdirectories. You can even start at a chosen subdirectory level and retrieve all of the file names below that level.

Order No. **Q05** ProDOS Library 3 \$26.95

DISK FIXER

The right tools for fixing disk problems.

■ **Disk MAP System** is a road map to your DOS 3.3 disks, showing you the exact location of your files and how much space they occupy. You can display and verify every sector on the disk, or to display a list of sectors used by a particular file. Automatic sector verification lets you know if some sectors are damaged, indicating that repair is needed. Documentation includes hints for fixing damaged disks.

■ **Disk MAP II** uses a snapshot method to instantly display a complete map of the disk, includ-

ing all of the occupied and free sectors, on just one screen. The display includes a code to the names of the files, so you can see exactly where your files reside on the disk. You can send the map to the printer for closer study.

■ **Disk Zap** zooms in to directly read the contents of a disk sector and display it on the screen in hexadecimal and ASCII format. You can then review, edit and print out the sector's data, and "zap" the disk by writing the modified contents back onto the disk. Simple, one-key commands let you step backward and forward to view the next or previous sectors. Or Have fun by creating hidden file names, modifying DOS and more! Includes detailed instructions for repairing a variety of disk problems.

■ **Disk Doctor** finds the cure for sick disks. It recovers accidentally deleted files — automatically! There's also an option that lets you remove DOS from your disks, creating unbootable data disks that let you store an additional 32 sectors of information — over 8,000 bytes!

Order No. **D02** Disk Fixer \$22.95

DISK LIBRARIAN

A complete library of powerful disk utilities.

■ **Disk Librarian Pro** catalogs all your disks and instantly creates a quick-reference master list. Wondering which of a dozen disks holds the file you want now? Disk Librarian Pro has the answer! It reads and stores the catalog information, and records whether it's a DOS 3.3, Pro-DOS or Pascal disk. You can display, sort and print hundreds of file names. The master list can even be transferred into AppleWorks!

■ **Sector Stretcher** gives your data room to grow. It clears up to 45 extra sectors, stretching the capacity of every DOS 3.3 disk you own. Perfect for database users who've seen the DISK FULL error message much too often.

■ **RAM Disk II** ends the disk shuffle. It adds a 16K electronic RAM disk to your system. Now you can store frequently-used utilities on a RAM disk tucked inside Apple memory. You get faster access and all disk commands work the same as with your regular DOS 3.3 disks.

■ **Diskoverer** is a fast, powerful DOS 3.3 disk zap program. Use it to rescue your damaged disks or inspect file formats. A range of features let you read from, display and write to any sector, in any of three ASCII formats. Diskoverer lets you easily page through a file, then change data or disassemble any portion of a sector.

Order No. **D06** Disk Librarian . . . \$29.95

Programming Productivity

MACHINE LANGUAGE MASTER

Take the pain out of machine language!

■ **Machine Language Editor** makes entering and editing machine language programs as easy as using a word processor. If you make a mistake and leave out some code, Machine Language Editor lets you go back and insert the missing bytes. Or if you mistakenly insert extra characters, Machine Language Editor lets you delete them, and the rest of the program fills in the space. Imagine the time you'll save and the frustration you'll avoid. A must for your library.

■ **Hexpad** is another tool to minimize the tedium of entering lengthy machine language programs. A phantom keypad provides fast, easy entry of hexadecimal data by using 16 keys on the Apple keyboard. No more hunting and pecking through the top row of keys.

■ **ASCII.Dump** demonstrates the use of opcodes and pseudo-opcodes, and allows you to examine the Apple's memory. ASCII.Dump lets you stop, pause, restart and step through a hex dump at your own pace. It also prints the hexadecimal values of numbers stored in memory and their ASCII character equivalents.

■ **Hex Sequence Finder** makes fast searches for all occurrences of a one to fifteen-byte sequence of hexadecimal numbers in memory. Use this speedy utility to debug your machine language programs or find Applesoft and DOS commands. You specify the area of memory to be searched and Hex Sequence Finder will scan it — instantly!

Order No. **P02** ML Master \$29.95

NEW!

APPLESOFT TOOLBOX

■ **Applesoft MatchMaker** helps you track different versions of programs you're writing, and points out the differences to make sure you're up to date.

■ **Applesoft Page Lister** provides you with an easy way to print professional-looking Applesoft listings. It makes sure that your listings don't run over the page perforations and it adds a title and page number to each page.

BASIC ASSEMBLER

Machine language programming the easy way!

■ **BASIC Assembler** produces machine language programs quickly and easily. Machine language programs run much faster than their Applesoft counterparts, but writing them can be much more difficult. This 6502 assembler (written in Applesoft) and its companion source editor simplify the task of writing programs in assembly language. A great way to start dabbling in Assembly Language programming.

■ **BASIC Assembler Enhancements** adds professional features to the BASIC Assembler. Now you can have printouts of the assembled listing that look just like the ones produced by commercial assemblers. You can also add full-line comments and two new pseudo-ops: ASC and HEX. Modifications to the editor allow 80-column editing. (Requires an 80-column card.)

■ **BASIC Disassembler** translates machine language code into symbolic source code that your assembler can read. Use it with the BASIC Assembler or Apple's DOS Tool Kit to modify, correct or enhance programs for which you have no source code. There's also a provision that allows easy customization for use with other assemblers.

■ **Machine Code Editor** reduces the tedium and potential problems of typing large machine language programs from books and magazines. It checks the validity of your entry by comparing it to the original, and shows you a disassembly as you enter each line of code. And if your evening isn't long enough to enter the entire program, save it and continue another day.

Order No. **P08** BASIC Assembler . \$26.95

DOCUMENTOR

Give your program listings that professional look.

■ **Navigator** makes program documentation a breeze! It's a BASIC listing utility and flow-chart formatter that reformats Applesoft listings and prints flowcharts complete with graphics symbols. Simplify the tasks of modifying programs and checking the logic by producing top-notch documentation with Navigator. (Requires a printer.)

■ **Pretty Lister** gives new character and clarity to your listings. It formats and indents your multi-statement lines so they print with that structured programming look. Indentation of FOR NEXT loops and IF THEN blocks helps you see the logic structure of Applesoft programs and make programs easier to read. (Requires a printer.)

■ **AMPOS** gives you a quick and easy way to position the cursor and print on both the 40-column and 80-column screens. This three-parameter ampersand command also fixes a bug in some IIe 80-column cards. Stop worrying about cursor control — let one simple statement handle it all for you.

■ **Sound Master** takes advantage of the sound capabilities of your Apple II. Use it to create dazzling sound effects and perfect harmonies, without any extra hardware.

■ **Disk Drive Tester** will help you keep your 5.25-inch disk drives in top shape. The program shows you the drive speed — just follow the article's step-by-step instructions to adjust it.

Order No.: **P15** Applesoft Toolbox . . . \$22.95

APPLESOFT STREAMLINER

Pare program execution time to the core!

■ **Applesoft Execution Monitor (AEM)** optimizes the performance of your Applesoft programs where they need it most. Inefficient routines can slow down your programs — even ones that appear well-structured. AEM spots the program statements that are executed most often, and prints a chart showing the relative execution frequency of each line. A powerful tool for optimizing Applesoft programs. (Requires an 80-column card and 64K of RAM.)

■ **Applesoft Line Cruncher** goes to work on your program to save memory and increase speed. This utility automatically compresses multiple Applesoft program lines, joining them wherever possible, to create compact multi-statement lines. When two lines are combined, and the savings in memory really adds up!

■ **Applesoft Anti-Line Cruncher** expands multi-statement Applesoft programs so that you can see each statement on its own line. To save time and space, "Crunch" your program; but to maintain a program with individual lines for easy readability, use the Anti-Line Cruncher.

■ **Super REM Remover** saves memory and improves execution speed by removing REMs from Applesoft programs and producing more compact code. Now you can have two versions of your program: a speedy, REM-less version and a fully documented program listing for reference.

■ **Applesoft Variable Cruncher** compresses long variable names to one or two letters, saving bytes of memory and dramatically increasing execution speed. Even better, you get the benefits of a shortened program without having to do any tedious manual editing.

Order No. **P04** Applesoft Streamliner \$22.95

■ **List Master** prints a formatted listing of your Applesoft programs that highlights REM statements, indents FOR NEXT loops and IF THEN statements, and separates each command on a separate line. (Requires a printer.)

■ **Compare Applesoft** lets you automatically compare different versions of your programs for changes, additions and deletions. Use it when you modify programs and want to share your enhancements with others. This is an absolute MUST for keeping track of revisions in programs that are continually being updated.

Order No. **P05** Documentor . . . \$22.95

BUDGET TRACKS

Tadpole Tutor

TADPOLE ALPHABET lets your preschooler learn the alphabet in an arcade style game.

BOUNCING NUMBERS is a fun Hi-Res number recognition program for preschoolers.

APPLE TIME TUTOR uses the Hi-Res screen with several clock formats and levels of difficulty for youngsters of different ages.

COUNTING QUIZ helps your preschoolers learn their numbers in Lo-Res and Hi-Res graphics.

FATHER'S FIRST PROGRAMS is a collection of four programs in graphics designed with children in mind.

Order No: **E02** Tadpole Tutor . . . \$14.95

Asset Manager

PERSONAL INVENTORY PROGRAM provides a complete disk based data management system for inventorying and tracking your personal assets. It is invaluable for insurance reporting.

DART (Debt/Asset Reporting System) is a home finance system for projecting future expenditures and debts. Project your net worth and test new investment and debt strategies.

LOAN REDUCTION ANALYSIS projects the effect of interest changes and loan terms in analyzing major financing purchases.

FINANCIER III provides loan reduction calculation, amortization, two types of depreciation, and simple and compound interest.

Order No: **F04** Asset Manager . . . \$14.95

TYPING NIBBLE LISTINGS IN FOUR EASY STEPS

There are four main steps to typing in a program:

1. Create a work disk.
2. Type in and save the CHECKIT program.
3. Type in the listing with CHECKIT installed.
4. Save the program to disk.

STEP 1: CREATING A WORK DISK

Most *Nibble* programs work with either DOS 3.3 or ProDOS. If you have one particular program in mind, check the article for operating system compatibility.

If you are using ProDOS, copy the files PRODOS and BASIC.SYSTEM from a ProDOS master disk or from your System Utilities disk to a newly formatted disk. Apple IIGS owners should copy the file P8 from the subdirectory /SYSTEM.DISK/ SYSTEM and rename it PRODOS in addition to copying BASIC.SYSTEM.

If you choose DOS 3.3 as your operating system, first boot your DOS 3.3 system master disk, then remove the disk from the drive and follow these steps:

1. Type NEW and press Return.
2. Type 10 HOME and press Return.
3. Insert a blank disk into the disk drive, type INIT HELLO and press Return.

STEP 2: TYPING IN CHECKIT

You're ready to type in the CHECKIT program shown on the following page. But before you type any program, clear the Apple's memory by typing NEW followed by Return. Remember, computers are very picky about how programs are typed. Be sure to type the program exactly as it is listed, including punctuation and spacing. After you've typed the program, save it on disk with the command

SAVE CHECKIT

STEP 3: USING CHECKIT TO ENTER A PROGRAM

CHECKIT watches your typing to see if you type a program line correctly. When you press Return at the end of a line, CHECKIT prints a number that will match the one published in the magazine if you've typed the line correctly. If the line is mistyped, the number printed won't match. CHECKIT runs only in the 40-column mode.

Once you've entered the CHECKIT program and saved it to disk, install it by typing

RUN CHECKIT

The first time you run CHECKIT, you may get the message "ERROR IN DATA STATEMENTS." If this occurs,

recheck the data statements at and before the line listed. Correct any errors and save CHECKIT to disk before running it again.

If there are no errors in CHECKIT you'll be given the option to choose whether you'll type an Applesoft or hexadecimal listing. Some articles have more than one listing and may contain both hex and Applesoft BASIC listings. You must RUN CHECKIT before typing in each separate listing. The article will describe the listings and identify them as either hex code or Applesoft BASIC code. The following two sections describe the process of entering an Applesoft BASIC listing and a hex listing.

Applesoft Programs

If the listing you wish to enter is identified as Applesoft BASIC, answer N to CHECKIT's question "Are you entering a hexadecimal file?" and the Applesoft BASIC version of CHECKIT will be installed. Once it is installed, you may begin typing in the Applesoft BASIC listing. Applesoft BASIC lines listed in *Nibble* begin with a CHECKIT code, followed by a line number and the Applesoft commands. Do not type in the CHECKIT code! Type in the line number and all of the characters up to the next line number before pressing Return.

Be careful to maintain spacing between quotes. Also, avoid resetting the Apple II when CHECKIT is installed. You can omit the comments after REM statements, although they usually contain useful information when you're reading the listing.

Let's enter a sample Applesoft BASIC listing. Boot your work disk and run the CHECKIT program. Since you're not entering a hex program, answer N to the question asked and CHECKIT will be installed in your Apple. Now you're presented with an Applesoft BASIC prompt character and a flashing cursor. You're ready to begin typing the listing. To enter the program shown in Example 1, type

```
10 REM RING THE BELL
```

followed by a Return. The CHECKIT code for that line (37) will be printed if you've typed the line correctly. If the code doesn't match, type the line again, paying careful attention to detail. Now type lines 20 and 30. After you've typed in the entire program, enter Control-Z (hold down the Control key and press Z) for the final check code. If the code you get doesn't match the printed code, you've probably skipped a line or have an extra line in your program.

EXAMPLE 1: BASIC.PROGRAM

```
37 10 REM RING THE BELL
54 20 FOR J = 1 TO 5: PRINT
    CHR$(7): NEXT J
91 30 END

TOTAL: 1CB9
```

Hex Programs

If the listing you wish to enter is identified as hex code, answer Y to the question asked by CHECKIT and the program will ask two other questions. It asks, "What is the starting address of the file?" and "What is the length of the file?" These numbers will be included at the top of the hex listings. Be sure the Caps Lock key is down when answering these questions and when entering the program. You'll have to enter the System Monitor with the command CALL -151. (The System Monitor is simply the part of your computer used for entering machine language.)

Machine language programs are published in a "hex dump" format. This means that an address is displayed followed by bytes stored in those addresses. The numbers may look unfamiliar because they are in hexadecimal (base 16) notation. For instance, in Example 2, the number stored in address 0300 is A2. In address 0301, the value 05 is stored.

To type in Example 2, you should boot your work disk and run CHECKIT. Answer Y to the first question asked. As you can see from the beginning of Example 2, the starting address is 0300 and the length is C. These numbers should be entered at the next input prompts. CHECKIT will be installed and you should see a System Monitor prompt. Now enter

```
0300:A2 05 20 DD FB CA F0 03
```

followed by a Return. The number 73 should be printed below your line. If it's not, retype the line. Now enter the second line in a similar fashion and press Control-Z for the final check code. Again, if this final number doesn't match, you've probably skipped a line in your typing.

EXAMPLE 2: HEX.PROGRAM

```
START: 300                                LENGTH: C
73 0300:A2 05 20 DD FB CA F0 03
80 0308:4C 02 03 60

TOTAL: E52E
```

To check your typing by listing the program, first type the address you want to check and press Return. This will display the address and the byte entered at the address. To display a range of addresses, type the first address you'd like to see, followed by a period and the last address. For example, to see addresses 0300 to 03A0, type

0300.03A0

followed by a Return.

Special Note for IIGS owners: When displaying an area of memory, an additional number followed by a slash (/) will appear before the address in your dis-

play. To the right of the eight bytes listed in the line, there will be eight additional characters displayed. These have no relationship to the numbers produced by CHECKIT and may be ignored.

STEP 4: SAVING THE PROGRAM ON DISK

You should save the program to your work disk periodically while entering the listing and after completing a program. Saving a program on disk is simply a matter of giving the correct command. This command is always given in the article accompanying the program listings.

Technical Support

If you run into a problem with a *Nibble*

program that you can't solve, send your questions and a SASE to the Nibble Technical Support Department at 52 Domino Dr., Concord, MA 01742. Phone support is available on the Tech Support line from Monday through Friday between 2 and 5 PM EST at (508) 371-1669.

Nibble Hotline

If you have a 300- or 1200-baud modem, you can reach our Nibble Hotline at (508) 369-8920. The latest errata are listed, and you can download one-liners or order Nibble/Mindcraft software. The parameters are 8 data bits, 1 stop bit, no parity, full duplex.

FONT

CONVERSION

**Convert
Publish It! fonts
to
system fonts
and
back again**

One of the more popular desktop publishing programs for the Apple II is Publish It! from Timeworks, Inc. It sports a Mac-like interface that anyone can learn in under an hour, and its printer interface has no rival among present competitors. The program's primary weakness is that it comes with only six fonts. To make matters worse, Publish It! fonts appear to be nonstandard. While programs like AppleWorks GS and Medley use standard Apple IIGS system fonts, which have a \$C8 filetype, Publish It! fonts have an \$F7 filetype.

Even though the filetypes are different, the IIGS system fonts can be converted to the Publish It! font format and vice versa. There are many ways to accomplish the conversion, with the most drastic being the use of a block editor to change the filetype in the disk directory. This method is both dangerous and tedious. The easiest way is to use the Font Conversion Utility (FCU) program.

FCU is written in Apple-soft BASIC and works only in ProDOS. The program requires only one disk drive, but for optimum performance, two

drives are recommended. FCU will convert most fonts, but the program size, combined with Applesoft memory restrictions, will not permit the conversion of font files larger than 25,635 bytes.

USING THE PROGRAM

If you are using a IIGS, you must make sure that Keyboard Buffering is set to No in the Control Panel under the Options page.

When FCU is run, a five-option menu is presented (Figure 1). You can select options from the menu with the arrow keys or by entering the desired option number and pressing Return. The first menu option permits the user to enter the prefix of the font's location.

The program will check drive 1 in slot 2 and both drives in slots 5, 6, and 7 for valid ProDOS volumes.

When all devices have been checked, the program will display a list of online prefix names. To select a prefix, use the Arrow keys to highlight the desired volume and then press Return. If the selected volume contains any subdirectories,

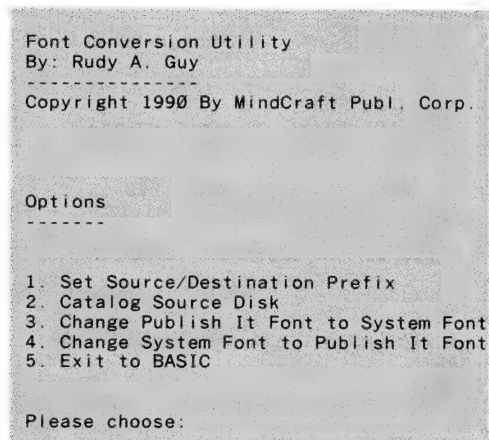

Figure 1: The five-option Menu

Rudy A. Guy, 1319 W. 10th Street, Erie, PA 16502. This program is compatible with ProDOS on the enhanced IIe, IIc, IIc+, and IIGS.

Table 1: Font Conversion's Structure

Line(s)	Function
80-280	Set up variables and display menu. Maximum number of fonts that the program will handle is 125. Change the DIM statement in line 90 to increase or decrease this number.
290-460	Get keypress and move cursor accordingly.
470-930	Set source/destination prefix.
880-910	Check for on-line volumes.
940-1030	Show catalog of source or destination drive.
1040-1060	Routine to convert Publish It! to System fonts.
1070-1090	Routine to convert System fonts to Publish It! fonts.
1100-1140	Message displayed if no font files are located in the source directory.
1150-1200	Set variables required for selected conversion.
1210-1220	Set prefix if option 1 has not been selected.
1230-1290	Read source directory and store font names in the array FT\$(). CTR contains the number of font files in the directory.
1300-1350	Read the destination directory to see if a PI.FONTS or GS.FONTS folder exists.
1360-1480	Display font name and prompt user for action to be taken.
1490-1540	Create PI.FONTS or GS.FONTS folder if needed. Convert font and place in appropriate folder.
1550-1570	Exit Program. Reset original prefix.
1580	Centering routine.
1590	Data statements containing possible slot and drive locations.
1600-1770	Error handling routine for font conversion portion of the program.

they will then be displayed. The selection procedure is the same as when the root volume was selected. If no subdirectories are located on the root volume, or in subsequent subdirectories, the program will move on to the "Set Destination" routine.

The destination prefix is set in the same manner as the source prefix. When both prefixes are selected, you are asked if the prefix settings are correct. If you enter an uppercase or lowercase "N," you will be returned to the selection process.

Once the source and destination prefixes have been set, the source and destination directories may be viewed by selecting option 2 from the menu. If the prefixes were not set using option 1, the catalog option will display the files contained in the directory from which FCU was executed.

Option 3 lets you convert Publish It! fonts to GS system fonts, while option 4 converts system fonts to Publish It! fonts. When either of these two options is selected, FCU searches the source directory for the appropriate font types and displays the font names. You can convert the font, skip it, or return to the program menu.

The fonts you convert are placed into a subdirectory that is named PI.FONTS or GS.FONTS. If the destination prefix was set to /DTP/FONTS, and GS System fonts are being converted to Publish It! fonts, the converted fonts will be located at /DTP/FONTS/PI.FONTS.

Memory Restrictions

To conserve memory, error trapping has been kept to a minimum. If an error does occur during the font conversion segment of the program, the error number will appear

and any conversions will be stopped. With the exception of the credit lines at the beginning of the listing, REM statements have been omitted. To see the structure of the program, refer to Table 1.

ENTERING THE PROGRAM

Type in the BASIC program from Listing 1 and save it with

SAVE FONT.CONVERT

For more help with entering *Nibble* listings, see the Typing Tips section.

THE JUNE 1990 DISK CONTAINS THIS PROGRAM

If you'd rather not type in the listing for this program, you can buy it on disk, complete, free of typos and ready to run. *Nibble's* June 1990 programs are available on a single disk for an introductory price of \$12.95 from *Nibble*, 52 Domino Dr., Concord, MA 01742. Add \$2.50 for shipping/handling within the U.S. and Canada; \$7.50 for overseas air mail. Introductory price expires 8/31/90; after that date, the price will be \$16.95. See the *Nibble* Software Directory in this issue for ordering information. ORDER NO.: W32

The Book with the Best...

Special
Prepublication
Offer

The Choice Apple II Programs from Nibble 1989 in One New Volume!

Nibble Express Volume X is a blockbuster anthology of the best utilities, applications, games, and tips and techniques from the 12 issues of *Nibble* published in 1989. You'll get programs for printing Hi-Res pictures, analyzing your AppleWorks spreadsheets, building your own databases, and much more!

Each program is complete and ready-to-type and run on your Apple IIe, IIc, or IIGS. Here's a sample of the 22 features:

- **Proof** — Verify that your AppleWorks spreadsheets are doing what they should by getting a neat printout of the formulas used in every cell.
- **Widgets** — In this business simulation game, you're president. Marketing strategy, R&D, strikes, and natural disasters all influence your bottom line, and whether you'll be asked to stay on for another term.
- **Nibble Assembler** — This full-fledged assembler will take the source code you enter from a word processor and turn it into fast-running machine language code.
- **Menu Pro** — Why type in commands to run files from your ProDOS disks? You select the program and let Menu Pro do the rest!
- **Number Cruncher** — This on-screen calculator has four memory slots, algebraic functions, and can print your results in formatted columns.
- **Treasure Dive** — Go for the gold in this underwater adventure, and watch out for the sharks!

• **Visisort Revisited** — Learn the ins and outs of sorting in Applesoft, with 5 different methods illustrated on the Hi-Res screen.

• **Database Construction Kit** — Create custom databases with special screens for data input.

Whether you're crunching numbers, creating Hi-Res pieces of art, organizing data, or just having fun, you'll have hours of enjoyment with *Express X*. Even if you're a *Nibble* subscriber, you'll enjoy having the latest versions of the top programs all together in one volume. It is one of the best collections of Apple II programs and tips you'll find anywhere!

Order *Nibble Express X* Today!

Nibble Express X — Item #B39 — \$14.95 plus shipping. (Special offer saves \$5.00, ends June 30, 1990)

To order, use the *Nibble* Products Order Card in this issue, or send your check or VISA or Master Card authorization to

► **Nibble Express**

52 Domino Dr., Concord, MA 01742

or call 1-800-888-1660 for credit card orders.

Please allow four to six weeks for delivery. Shipping — \$3.00 U.S. & Canada, \$6.00 overseas surface, \$9.00 overseas air. Payment must be in U.S. funds & drawn on a U.S. bank. Mass. residents add 5% sales tax.

ODOMETER

Put some miles

on your Apple

A car is a major investment. Many people spend more for automobiles in their lifetime than they do for housing. After spending a large sum, you have many other operating, maintenance, and insurance expenses over the years. Did you ever wonder how much your car costs you? Odometer helps you answer this question.

Odometer tracks operating costs and mileage for one or more cars. Several reports let you know the operating cost per mile and average miles per gallon (MPG) for each car.

USING THE PROGRAM

When you run the program, you will be faced with the main menu. Move the menu cursor with the arrow keys and press Return to make your selection.

If you are using the program for the first time, choose the third option, Configure/Start or Delete. This menu has four choices. Choose the configure option. Enter Y if you have a printer and Y again if you have 80-column capability. If you don't have a printer or 80-column card, enter N for both. Press Return to accept the default value displayed at the cursor.

After you configure the program, you must enter information about your car. First enter the car name. If it already exists on the disk, you will be told so and given options to abort the operation or replace the original data. The name of your car can contain up to 11 characters (but they must all be valid ProDOS characters).

Once you've entered your car's name, you must enter the current mileage on its odometer. You should enter this when you have a full tank of gas. This will ensure that all future mileage calculations will be accurate. All future mileage entries should come from the car's trip odometer, which must be reset to zero each time you buy gas. You can include up to six cars.

Your next step is to enter data. The car you most recently used will be the car you enter data for. (If you wish to change cars, use the main menu's Select Car option.)

On the data entry screen, underscores show you each item's maximum length. When

Matt Cox, 7 Harm on Place, New City, NY 10956. This program is compatible with DOS 3.3 and ProDOS on the enhanced IIe, IIc, IIc+, and IIGS.

What's the value of a new idea?
A new idea is rare. . . and sometimes even priceless.

IDEAS → POWER

The Third Book of Apple Secrets is loaded with new ideas... tips, techniques, and short programs that unlock the power hidden within your Apple II.

This new, carefully-selected collection of the best Tips and Techniques from *Nibble* magazine will make your Apple do things you never thought possible... with just a few minutes of your time. And you won't find them anywhere else!

Speed and Power

Experts reveal the secrets they use to increase the speed of their BASIC programs by up to 300%! And you'll see how to build bridges between BASIC and Assembly Language for really amazing speed.

Graphics Galore

Discover the ZOT, a dynamic graphics character with amazing versatility. See how 3-D graphics work — and find out how to swap graphics fast, or how to put Double Hi-Res characters on your graphics screens.

Windows and Text

Tap the power of text screen windows (like the Macintosh) and do it with Applesoft. You can even make AppleWorks-like menus work with your machine-language programs — or use a mouse to control your own program menus.

Automatically format your text screens with word-wrap, page breaks, and upper/lowercase conversions — a little program does it. And another counts the words in your text files.

Programming Made Easy

Let's face it, everyone makes errors in programming. You'll get a short but powerful Error Lister that reveals not only the line where the error occurred, but the statement that caused it. Or you can use the Poor Man's Line Editor to correct errors with ease.

Dabbler or Expert

Whether you're an expert or just learning how to program, *The Third Book of Apple Secrets* is an invaluable addition to your library.

Each of the more than 40 secrets is a new foolproof method for streamlining your Applesoft and machine language programs. The authors give detailed descriptions of the programs, so you see how they work. And the demonstration programs show you how to use the techniques yourself.

And you can also get all the programs from *The Third Book of Apple Secrets* on disk!

It takes only a few minutes to put the power of new ideas to work in your Apple.

P.S. If you want even more ideas, don't miss the first two volumes: Apple Secrets and More Apple Secrets, advertised in the Nibble Library in this issue.

nce Upon A Time Only Advanced Programmers Could Achieve Machine Language Speed.

But today *anyone* with just a basic knowledge of programming can write programs that run at machine language speed. It's easy with MACROSOFT, a new language that works with The Assembler.

Using MACROSOFT, you write Applesoft-like programs which are converted into machine language by The Assembler. Like magic. You get the benefits of speed and efficiency without the hassle and hard work of learning machine language!

Imagine, running your programs up to 10 times faster than compiled Applesoft. That's up to 50 times faster than regular Applesoft!

Create lightning-fast games and spectacular graphics. Ideal for number crunching! For the more advanced programmer there's the convenience of mixing assembly language and MACROSOFT in the same program.

Now you don't have to be a magician to move up to machine language — with MACROSOFT!

To order fill out the attached coupon or call 1-800-888-1660.

Shipping: Add \$2.50 within U.S. & Canada. Add \$7.50 Overseas Air Mail. Mass. residents add 5% sales tax. Payments must be in U.S. funds only.

entering data, press the Return key to move on to the next field. Pressing Control-S will accept the data you entered.

The first item you enter is the transaction type. There are two categories. The first, Gas Fill Up, requires that you enter the date, miles on trip odometer at the time of fill-up, and the quantity (in gallons) of gas. You can also include comments.

The second category, Any Other Expense, gives you space to enter all other operating costs of your automobile and comments relating to the payment. These may include oil, maintenance, insurance, monthly payments, lease payments, depreciation, and so on. You must also enter the date.

You may enter M to get back to the main menu.

The date field is eight characters long. Enter the date in the mm/dd/yy format. You can enter the month or day as one digit, but all three items must be entered and separated by slashes (/) only. A beep will sound if your input is unsatisfactory.

The amount of transaction is the total cost of the items involved. It can be eight characters long. If you got whatever you got for free (your uncle owns a gas station), enter 0 — don't just press Return.

The comment field is 20 characters long. Include any comments you find relevant. All characters, including the colon and comma, are "legal" in this particular field.

After all the data is entered, you will be back up at the date field again. If everything is correct, press Control-S and it will be saved to disk.

Once you have entered some data, you will want to create some reports. Three are available: Cost & Mileage, Mileage alone, and Cost alone.

The Cost & Mileage report displays the records for any single year (or all years) and shows you miles per gallon, cost per mile (for each fill-up at total), the current odometer reading, your comments, and totals and averages for everything. You must have an 80-column card or a printer to get this report. The mileage report shows miles, gallons, and MPG, and the cost report shows dates, costs, and comments.

The program's last option is car deletion. To delete a car, select the third menu option, choose the delete option, choose the car you want to delete, and confirm the action when the program asks.

ENTERING THE PROGRAM

Type in the program from Listing 1 and save it with

SAVE APPLE.ODOMETER

For more help with entering *Nibble* listings see the Typing Tips section.

HOW THE PROGRAM WORKS

I set the data file's record length to 55 bytes. This is a little more than you need, but it provides a margin for expansion or modification.

The program creates three files. The first is the system configuration file, which contains the printer slot, 80-column card slot, and 80-column to 40-column control code. The second file is the Names file, which keeps track of the names of the cars on file. Finally, each car has a file. Record 0 contains the starting mileage and the number of entries. Each other record contains a transaction. This file is a random-access file; the other two are sequential files.

HARDWARE, SOFTWARE
& ACCESSORY ITEMS
IN STOCK!

LASER 128EX®

The Laser 128EX®.....\$389.95

- Is 3 times faster than an Apple IIc or IIc
- Has everything built-in, including a disk drive & interfaces to all your peripherals
- Is expandable
- Performs like a top-of-the-line Apple

The Laser 128EX/2™...\$469.95

• Surpasses even the Apple IIc Plus

- Includes a ProDOS®-compatible real-time clock & MIDI interface for musical instruments
- Comes with a 5 1/4" internal ability to daisy chain drives just like a IIgs

NO ONE CAN SELL THIS PRINTER FOR LESS!

"We Love Our Customers"

GET

24% MORE MEMORY

without hardware

It seems incredible — but it's true. No matter how much physical memory your Apple II system has, your AppleSoft programs and data can use only 36K... until NOW. ProHigh is a remarkable software product that adds nearly 9,000 bytes to useable Applesoft program space.

► Bigger Programs and Data

With ProHigh, you can:

- Write larger, more powerful programs that used to be impossible.
- Hold a lot more data in memory
- Avoid the dreaded OUT OF MEMORY message.
- Design exciting graphics programs by using the added memory as an extra Hi-Res graphics page!

► How Does It Work?

ProHigh works its magic effortlessly, with all Apple II series computers that have at least 64K of memory. It lifts the program memory restriction by moving the Disk Operating System (DOS 3.3 or ProDOS) out of program memory and into auxiliary RAM. It's as simple as booting the ProHigh disk. And your programs use the 9K of added memory automatically! (Note: With the Apple II Plus, ProHigh relocates DOS 3.3 but not ProDOS.)

Get BIG MEMORY NOW! with ProHIGH!

I want ProHigh! Here's my \$29.95 (C33)

Add shipping & handling \$2.50 U.S. & Canada — \$7.50 Overseas Air Mail. Mass. residents add 5% sales tax. Payments must be in U.S. funds only.

Table 1: Program Routines

Line#	Purpose
80-140	Define variables & the main menu
150-210	Start transaction entry, define variables, read files
220-270	Set up entry screen
280-350	Start entry, get transaction type
370-540	Enter expense only
380-450	Enter date
460-500	Enter amount
510-530	Enter comments
560-630	Enter date
640-700	Enter amount
710-740	Enter miles
750-780	Enter gallons
790	Calculate and display MPG
800-820	Enter comments
850-870	Write disk file, clear variables, go to menu
890-900	Trap errors, quit if recovery not available
940-2380	REPORTS
910-920	Read & set up configuration file
930-960	Check to make sure car has data, do menu
980-1510	Cost & mileage report
1020-1080	Get output mode and year to print for
1090-1110	Print headings
1120-1240	Display each entry and total some columns
1310-1320	End report, calculate averages
1330-1340	Finish up, turn off printer/80-column card
1350-1370	Do expense-only output
1380	Get output type
1390-1720	Format output routines
1410-1460	Format date
1470-1510	Format miles
1520-1560	Format gallons
1570-1630	Format & calculate MPG
1640-1690	Format amount
1700-1770	Format & calculate cost per mile
1780-1970	Mileage report
1800-1810	Get output type
1840-1850	Print headings
1870-1920	Print each record, total up miles & gallons
1940-1950	Calculate totals & averages, finish report
1960-1970	Finish up, turn off printer
1980-2190	Cost report
1990-2030	Get output type
2040-2050	Print headings
2060-2180	Get & print each record, total cost
2200-2210	Error trapping for all reports
2220-2880	CONFIGURE/START/DELETE
2230-2240	Menu & titles
2260-2410	Configure system
2430-2790	Start new car
2800-2990	Delete a car
3000-3040	SELECT A CAR
3050-3060	Routine to read configuration file
3100	Routine to exit gracefully
3110-3510	MAIN SUBROUTINES (called often)
3490	Center line
3280-3300	Routine to print title on top of screen
3330-3460	Line input routine
3470	Yes/No/Menu question
3490-3510	Error Trapping (Control-C check) and Exit

The program contains many routines that will be useful in other programs; Table 1 lists all the routines and subroutines. The most useful has to be the menu routine in lines 3150-3270. Set the variable NC to the number of choices, the elements of the array CH\$() to the name of each choice, and call the routine. The routine returns the value of the

choice taken in the variable C. If you choose the top entry, for instance, C will contain 1. Line 3140 contains a routine to center a line on the screen. Just set A\$ equal to the line you want centered, and GOSUB to the routine. The line will be printed at the current vertical cursor position.

In lines 3320-3440, you'll find a routine that allows you to define the maximum length of an input string (to a maximum of 255). Set LN equal to the length of the string, A\$ equal to the prompt, VP equal to the vertical position, and call the routine. Arrows are printed around the area where the string is to be entered. For instance, if A\$="ENTER NAME" and LN=15, you will see on the screen:

```
ENTER NAME  ->          <-
```

You can also call this routine at line 3330 if you don't want the arrows and prompt to appear. Just set VP and LN like before, and set HP to the horizontal position on the screen. This is what I did in the transaction entry routine.

THE JUNE 1990 DISK CONTAINS THIS PROGRAM

If you'd rather not type in the listing for this program, you can buy it on disk, complete, free of typos and ready to run. *Nibble's* June 1990 programs are available on a single disk for an introductory price of \$12.95 from *Nibble*, 52 Domino Dr., Concord, MA 01742. Add \$2.50 for shipping/handling within the U.S. and Canada; \$7.50 for overseas air mail. Introductory price expires 8/31/90; after that date, the price will be \$16.95. See the *Nibble* Software Directory in this issue for ordering information. ORDER NO.: W32

Let us Entertain You . . . 26 Different Ways

Your Apple Games Gallery II

Your whole family will enjoy this great collection of 26 of the hottest arcade, strategy, and education games from Nibble — complete with disk. Start playing right away. Then learn how the experts control animation, strategy, and graphics with articles that show how each game works.

Arcade

ANTS — Giant ants are invading your back yard.
 CITY CENTURIAN — Defend the cities of the moon.
 CLAM BAKE — The clam is hungry and determined.
 CLAUSTROPHOBIA — Dodge bombs as you fire on aliens.
 EXTERMINATORS — Attack, or teleport to safety.
 PENGUIN — Help Sammy the Penguin save his island.
 FIVER DICER — Apple Yahtzee is here.
 NIBBLE 500 — Racetrack arcade action.
 STARLASER — Pit your skills against the Kloryon battleships.
 VORATIO — Beware the poisonous mushrooms.
 SPACECADE — Your ultimate coordination test.
 TREASURE DIVE — Pillage for buried treasure.

Strategy

BRIDGES — Capture all 20 golden cups.
 HAND PUZZLE — Two classic brain teasers.
 TANK COMBAT — Outmaneuver the enemy to win.
 ARTILLERY DUEL — It takes perfect judgement and planning.
 OTHELLO — Hi-Res action with the classic board game.
 SEA WOLF — High seas combat with the fleet.

Education

WIDGETS — Be President of your own company.
 LEARN THE USA — Learn states and capitals.
 LIFE — Keep your colony alive and growing.
 MATH MARATHON — Arcade tutor makes math fun.
 SHARK — Be math-sharp or your fish is shark bait.
 NOGGIN — Your words are hidden in the maze.
 COMPASS QUIZ — Learning directions for the kids.
 TADPOLE ALPHABET — Alphabet soup for little ones.

Order YOUR Apple Games Gallery II today.

Item #B38 (book and disk) \$22.95

Plus shipping: \$3.00 U.S. & Canada, \$6.00 Overseas Surface, \$9.00 Overseas Air.
 Payment must be made in U.S. funds, drawn on a U.S. Bank. Mass. Residents please add 5% Mass. Tax

 Concord, MA 01742
3. Or Call: 1-800-888-1660 with your credit card.

Many people still use the old DOS because there was so much good software written for it. It is easy to learn, easy to modify, and easy to use from machine language. We acknowledge that our readers are looking for state-of-the-art information and programs. We also know that they seek new methods to use the gigabytes of older DOS 3.3 material.

The two DOS 3.3-related programs in April illustrate our commitment to support the old Apple II users in their quest to take advantage of newer technology, by simplifying the porting of programs from DOS 3.3 to ProDOS (ProDOS Linker), and speeding up existing DOS 3.3 programs on the IIGS (RAM Disk 3.3).

By the way, we certainly share your

dream for the future of the Apple II with a 20 Mhz processor! We'd love to see one too.

VERSATILITY II

► This is a letter to tell you how great the Apple II is. I have a IIGS, and I have not found any application I cannot do with the IIGS, AppleWorks, and the TimeOut series from Beagle Bros. I use it in my home, business, and education. Examples include science projects for school, kitchen inventory and lunch count at the school, membership, finance, desktop publishing for a dairy goat club, and of course budgets, cash flows, and taxes.

I would like to encourage you to keep up the Apple II line, and to push it aggressively for all types of applications.

I am a member of Big Red Computer Club and National Appleworks Users Group.

Becky Jo Schnauffer
Keyes, OK

REVIEWING REVIEWS

► I must address a few comments in Neil Shapiro's review of 2088: The Cryllan Mission (April 1990). As you know, my brothers and I have been submitting programs to *Nibble* since 1982. In 1988 we formed Victory Software to write 2088.

The review closes by stating, "But it was obviously a family effort in programming and design that might well have benefited from an outside editor." Neil's remark would imply that family-owned companies are inferior to more corporate counterparts.

I cannot agree with his comments regarding our manual, since we have not received complaints from our customers. Furthermore, I cannot agree with his comments regarding our novel approach to conversation. In fact, our customers have enjoyed it.

Many companies have completely ignored the need for IIGS-specific software. Victory Software, however, has written a true IIGS application and, in the process, created a role-playing game with some unconventional features, such as our conversation.

While many companies are deserting the Apple II market, Victory Software has made a strong commitment to the Apple IIGS. In a few months, we will release two more IIGS-specific products.

Vinay Pai
President
Victory Software
Houston, Texas

"...the single most important business-oriented product for the Apple II since AppleWorks."

APPLE II

BY CHARLES H. GAJEWAY

Masterful database. Are you ready for a sweeping statement? Here goes: I think that *DB Master Professional* (Stone Edge Technologies: \$295) is the single most important business-oriented product for the Apple II since the introduction of *AppleWorks*. As the only true relational database program for the Apple IIe, IIC, and IIGS, *DBMP* can give a 128K Apple II the kind of data-handling power and flexibility normally associated with MS-DOS and Macintosh systems running expensive and hard-to-learn software. (A relational database can link, or *relate*, information from several data files.)

I jumped right into the program with my standard test data—a pair of files that tracks a record collection, with information on album titles, artists, music category, song lengths, and composers. This test is complex, and many well-regarded programs—including *AppleWorks*—have failed miserably at it. Even with very little

experience, I was able to get the system up and running with *DBMP* in a surprisingly short time.

Report generation is extremely powerful, making it easy to design anything from a mailing label, to a point-of-sale invoice (that automatically updates inventory records, of course), to customized form letters. Whereas most database programs must be combined with a word processor to do complex reports or mail merge, *DBMP* does it all.

The manuals are complete, well illustrated, and generally clear, although they are sometimes overly technical and fragmented. You will need to keep both books handy at all times, especially as you try out some of the more sophisticated features. And while the program is operated with a simple menu system, *DBMP* takes a fair amount of time to learn because of its array of features and options. *DBMP* gives you all the power you need and can even import your current files from *AppleWorks* (except version 3.0) and other programs. ■

Reprinted with permission from *Home Office Computing*.

Neil Shapiro replies:

My comments about 2088 were, for the most part, positive. But I did call out two faults with the game. The more subjective of these was that the dialogue given to the townspeople seems to be overdone, too long, and certainly not realistic. This is an opinion, but I feel most people who play

2088 will agree.

My complaint with the manual is not so subjective. It lacks complete diagrams of screen displays, a tutorial, charts of opponents' strengths, and a step-by-step explanation of combat.

I did state that "once you get past the manual, if you can treat the townspeople with a sort of half-eared indul-

gence, I think you'll find 2088 to be the first RPG to take full advantage of the Apple II GS." I agree that it was a "bold and unconventional approach." I also agree that Victory has created a "true GS application." That's why I recommended that people investigate the game. 🍏

THE ERROR TRAP

■ **Another Applesoft Mover** (Vol. 10/No. 8, Listing 1: MOVER, p. 57): Two lines were left out. Insert the following two lines between lines 63993 and 63994. You will either have to renumber the program in order to do so, or retype lines 63989 through 63993 and start numbering them at 63985.

```
63993 AL = 16385:AH = 16386:L =  
( PEEK (175) + (256 * PEEK (176)))  
- 2048: REM set high and low  
byte pointers and length of prgm
```

```
63994 POKE AH, PEEK (AH) + 64 -  
8:AL = PEEK (AL) + (256 * PEEK  
(AH)):AH = AL + 1: IF(AH - 16386)  
< L THEN 63990: REM parse through  
prgm and change high byte pointers
```

■ **Hi-Res Color Scout** (Vol. 11/No. 4, Listing 2: COLORSCOUT.BIN, p. 75): The commands to zero memory were incorrect and cause the program to break into the system monitor. If you used an assembler use the following command after CALL-151:

```
2112:0 N 2113>2112.21FEM
```

If you entered Listing 2 enter the following commands:

```
BLOAD COLORSCOUT.BIN  
CALL-151  
2108:AD 13 21 85 43 A0 00 4C 2C FE
```

Press Control-C, then enter

```
BSAVE COLORSCOUT.BIN,A$2000,L$78F
```

Tech Support

If you need help with your *Nibble* program, contact the Nibble Technical Support Staff at *Nibble*, 52 Domino Drive, Concord, MA 01742. Please include a self-addressed, stamped envelope. Phone support is available on the Tech Support line from Monday through Friday between 2 and 5 PM EST at (508) 371-1669.

Nibble Hot Line

If you own a 300- or 1200-baud modem, call the Nibble Hot Line to receive the latest errata notices, download a One-Liner, or order a Nibble/MindCraft product. The Hot Line provides up-to-the-minute, 24-hour technical information on *Nibble* programs plus other Apple goodies. Have your Apple call our Apple at (508) 369-8920. Set your communications software at 8 data bits, 1 stop bit, no parity, full duplex. The Hot Line will automatically determine the correct baud rate. 🍏

Juice Plus 1 meg \$125
Juice Plus 2 meg \$199
Juice Plus 4 meg \$399

Due to a volatile chip market,
prices are subject to change
without notice.

For three years Ingenuity has been selling IIGs memory boards at an exceptional value. You can be assured of continued software and hardware compatibility because we strictly follow Apple's design standards. When the new gs arrived our Juice Plus board was one of the few memory boards that remained compatible without having to make any hardware changes.

Don't be fooled by the over used adage "you get what you pay for". We use the same high quality parts that others use, but our philosophy is good value not just good profit. After comparing our price, service, and performance, then you'll stick with us without getting stuck.

TRAINING WHEELS FOR APPLEWORKS

■ Learn how to use AppleWorks on your way to work. Just pop in the new tape from NAUG (the National Apple User's Group), watch the road, and listen. This new 90-minute tape, **How to Use the Features of AppleWorks 3.0**, showcases Dr. Warren Williams describing how to use the more than 50 new features added to

the latest version of AppleWorks. The tape costs \$9.95 including shipping. *The National Apple User's Group, Box 87453, Canton, MI 48187; (313) 454-1115.*

CIRCLE NUMBER 158

A SPECIAL FIESTA

■ If you love to mix a good time with the love of all Apple computers, get tickets now for the June 15-17 **AppleFiesta '90** in Tempe Arizona, sponsored by the AzApple/Mac User Group. This fourth annual show at the Sheraton Tempe Mission Palms will feature up to 50 vendor displays, seminars, and user group and public forums. The advance reservation ticket price of \$8.00 is

available through June 1. Apple Computer will be taking four booths, and will show its support by sponsoring a breakfast and a hospitality suite and supplying more computers and equipment. Some of the other Apple II vendors at the show include Beagle Bros, Chinook, Broderbund, Applied Engineering, Ingenuity Inc., Stone Edge Technology, Roger Wagner, and Addison-Wesley. *Apple Fiesta 1990, P.O. Box 34056, Phoenix, AZ 85067; (602) 992-5515.*

CIRCLE NUMBER 159

NOT JUST SINGLE FILE

■ The telecommunications service **America Online** offers Apple II and Macintosh owners a combined 10,000 public domain and shareware files. The files are quality-checked by forum leaders in such areas as business, communications, desktop publishing, user groups, and utilities, among others.

Compression and decompression programs are included with the America Online software, which costs \$5.95 a month and hourly rates of \$5 evenings and weekends, \$10 weekdays. *Quantum Computer Services, Inc., 8619 Westwood Center Dr., Vienna, VA, 22182; (800) 227-6364.*

CIRCLE NUMBER 160

ASK NIBBLE continued from page 9

Table 1: PIN Values

Position	Value	Meaning	Purpose
1	1	Printer	Mode of serial port
	2	Communications	
2	1	6 data bits, 1 stop bit	Serial data protocol
	2	6 data bits, 2 stop bits	
	3	7 data bits, 1 stop bit	
	4	7 data bits, 2 stop bits	
	5	8 data bits, 1 stop bit	
3	6	8 data bits, 2 stop bits	Baud rate
	1	110 (bits per second)	
	2	300	
	3	1200	
	4	2400	
	5	4800	
	6	9600	
4	7	19200	Parity setting
	1	None	
	2	Even	
	3	Odd	
	4	Mark	
5	5	Space	Screen echo control
	1	No screen echo	
6	2	Screen echo	Line feed after Return?
	1	No LF after CR	
7	2	LF after CR	Return after "x" characters
	1	No CR	
	2	CR after 40 chars.	
	3	CR after 72	
	4	CR after 80	
	5	CR after 132	

These commands are usually done by printing a Control-I character followed by a value and a modifier character. For example, to set the baud rate to 9600 baud, a BASIC program would use the line:

```
PRINT CHR$(9); "14B"
```

"14" is the control value for the Control-I-x-B command for the Super Serial Card or Apple IIc (or IIGS) serial port. The space allotted for this column is insufficient for a complete listing of serial port commands, but the information you need is in the manual for the Super Serial Card and in the reference manuals for the Apple IIe, IIc, or IIGS.

Coming Soon!

► **Virtual Memory** — Your Applesoft arrays can now be as large as your disk media! This machine-language utility will store and retrieve large arrays from a disk in small portions as they are needed by your program.

► **Disk Encrypter** — Keep unwanted eyes from viewing your disks by encoding the entire disk. Only you will know the password to decipher them.

► **Pawns** — Practice your chess strategy as you face off against the Apple in a race of pawns on the Hi-Res screen.

Send In Your Entries!!!!

The One-Liner and Two-Liner Contests are ongoing events with several winners chosen every month! If you're one of the lucky winners, you can choose your favorite Nibble disk as your prize... just for having fun on your own. All you need to do is create the most interesting, attractive, useful, and/or clever program that can be typed using just one or two program lines.

Since this issue of *Nibble* will be hitting the newsstands so close to the Fourth of July, it seemed only fitting that a Hi-Res display of fireworks should win a prize. Just type in this two-liner, run it and watch as the fireworks explode on your monitor. For Fireworks, Ben Houston of Delta, BC, Canada will be receiving the Nibble disk Super Works.

So the award shows are over for another year. We now know who the best actor, actress, movie, singer, etc. were for 1989. If you're like most of us, you were not

fortunate enough to get your name up in lights. Curt Esser of Crystal Lake, IL, has a solution. MARQUEES is a two-liner that puts your name, or any other message, up in lights on the Apple screen.

When MARQUEES is run, a question mark will appear on the screen. At this prompt, enter the number of lines of text contained in your message (1-10). The program will then prompt you, with a question mark, for each line of your message. Each line of the message can be no more than 37 characters long. After the last line of the message is entered, the marquee is lit and your name or message will appear in lights for all to see.

```
BC 1 S = 38: INPUT N: FOR I = 1
    TO N: INPUT A$(I): NEXT

If you like to peek around in the Apple's memory, give ADDRESS.PEEKER, by Richard McMillan of Commerce, GA, a try. When this one-liner is run, you will be prompted for the beginning and ending memory locations that you would like displayed. Be sure to enter these locations in decimal format. After this information is entered, the decimal and hexadecimal value of the first memory location will be displayed on the screen. Each subsequent keypress will display the contents of another memory location. ADDRESS.PEEKER is ProDOS and DOS 3.3 compatible.

Typing These Programs ★ ★ ★ ★ ★

Here are a few tips for typing in one-liners and two-liners. Be sure to omit spaces when typing in Applesoft programs, unless the spaces appear in strings between quotes, or in REM or DATA statements. You'll find it easier (and often essential) to substitute the question mark (?) for the PRINT statement. And when typing in machine language programs, it's safe to type in just the second digit of a hexadecimal pair if the first digit is a zero, e.g., the hex pair 03 can be typed in simply as 3. For more information on typing in programs, see the Typing Tips section.

The Ground Rules ★ ★ ★ ★ ★

Your programs must be your own, original work and may be written in Applesoft or machine language. You must be able to enter your program directly from the keyboard, without using a programming aid or line editor. Programs must be submitted on disk, accompanied by an 8.5- x 11-inch sheet of paper with your name, address, Nibble disk choice, program instructions and the words "One-Liner Contest" or "Two-Liner Contest."

Send your entries to Nibble, 52 Domino Dr., Concord, MA 01742. Entries become the property of MindCraft Publishing Corp.

**Microsoft Works • WordPerfect
Lotus 1-2-3 • dBase III & IV**

It's easy! Just select file names to send from the menu. In seconds, **CROSS-WORKS** copies the files in either direction between your Apple II and IBM PC, and translates the file formats. Word processor files keep underlining, bold, centering, etc. Spreadsheets maintain formulas and data. Transfers ASCII text files, too. Includes **universal 19,200 baud cable** to connect **IIe** (with Super Serial Card), **IIc**, **IIcPlus** & **IIgs** to PC, XT, AT, PS/2 & compatibles. Supports modern transfers too. **AppleWorks** version 1.0 through 3.0 compatible. Includes both 5¼ & 3½ inch disks.

RATES AND DEADLINES

PAYMENT

1 x Rate: 5 line minimum at \$67.50. Additional lines: \$13.50 per line.

3 x Rate: 5 line minimum at \$62.50. Additional lines: \$12.50 per line.

6 x Rate: 5 line minimum at \$57.50. Additional Lines: \$11.50 per line.

Logo: \$75 additional (must be submitted camera-ready, no larger than 2" x 1").

All ad placement must be prepaid. Checks, MasterCard and Visa accepted.

Your sales message consists of 1 bold headline (35 characters maximum) and 4 lines of body copy (50 characters/line maximum). Company name, address and phone # are free and should not be counted as part of the 5 line minimum. All ads are set flush left.

DEADLINES

Typed copy and prepayment must be received by the 1st of the second month prior to the cover date, e.g., March 1st for the May issue. All ads received after the deadline will be held for the next issue. No verbal reservations are accepted. All copy subject to approval.

To place your ad, send your typed copy and prepayment, or address further questions to: **Nibble, Classified Ad Dept., 52 Domino Drive, Concord, MA 01742, (508) 371-1660.**

Do it Yourself Programs!

You'll be amazed by what YOU can do!

You don't have to be a professional chef to cook a great meal, or a professional photographer to take excellent pictures. And you don't have to be a programmer to enter original programs into your computer and run them! With our magazines, you learn about programs by creating them yourself... with complete listings and step-by-step instructions.

The programs you get will be valued additions to your collection — programs for home finance, games, power utilities, graphics, personal productivity, and education. You'll learn secrets of the experts, see how things work, and even pick up techniques for creating your own original programs. It's easy when you take it a step at a time with *Nibble*, or *PC Hands On* as your guide.

Apple II Owners — *Nibble* is for you! Applesoft BASIC, AppleWorks, and even Assembly Language will delight you.

PC/Compatibles Owners — *PC Hands On* explores BASIC, C, and other popular programs in terms you can really understand.

There's More! Each issue gives hands on case studies that show you how to make better use of popular commercial programs for YOUR computer. Track your investments with AppleWorks... Create a Newsletter with PageMaker... Forecast sales with 1,2,3... and much more!

Design Your Own Home, Landscape

It's one thing to design the landscape around your house with trees and fountains, but it's absolutely amazing to do it with **Design Your Own Home, Landscape!** It's thrilling to see what tree planting ideas will look like after 10 or 30 years of growth, an imaginative feature of the program from Abracadata.

Landscape for the IIGS, also available for the IIe and IIc, lets you draw a basic outline of your house, and then select plantings to put around it. Working in a top view of your house and land, you place the plantings you want from a selection of 28 trees and 17 shrubs. You can add objects to your house and yard, such as picture windows and a storage shed.

Once your basic trees, shrubs, and objects are placed using the mouse and standard cut, paste, and move procedures, you can view them from any of four sides. This gives you the perspective of approaching the house from any direction. In these views, and the top view, you can select any or all of the foliage and adjust their age using the mouse and a scroll bar. You may find that a tree is too overpowering for the view you want from the street, or that it would shade the house too much.

There are limitations to the detail you can attain with this portion of the program. For instance, you can't draw a driveway or sidewalk in the top view, nor can you add ground covers or grasses. For adding these details, you need to use the Finishing Tools. You can add any type of object, and additional views are included for the sheds, fences, and windows. A color monitor makes this feature a lot of fun, as you have a lot of options for palettes and patterns. Text can

also be added with the finishing tools.

If you still want to jazz up your landscape plan more, a separate Paint Your Own Home program provides a fairly complete draw program, complete with a small clip art library of trees, sports, architectural shapes, and miscellaneous items. When you're finished, you can print your design on an ImageWriter or LaserWriter. And if you have the program add numbers to the trees and shrubs, you can have it print out a shopping list!

Additional clip art files of trees and shrubs are available for the South, East, Southwest, and Northwest regions of the U.S. These are paint-layer disks that are more realistic than the

object-layer plants.

If you need ideas for planning your landscape, 24 sample plans are included with the package, and you can order an additional disk of 48 drawings. These are all variations on the themes contemporary, traditional, colonial, Spanish, Victorian, and Saratoga.

Landscape is a fun program to use, and indispensable if you are toying with various designs for the greening of your yard. Its 80-page manual has an extensive table of contents that makes up, for the most part, for the lack of an index.

Landscape complements the two other Abracadata programs in the Design Your Own Home series: Architecture and Interiors. Landscape for the IIGS comes on two 3.5-inch disks and costs \$89.95. The IIe, IIc, and IIc Plus version comes on 5.25-inch disks and costs \$69.95. Supplemental disks cost \$29.95. Contact Abracadata at P.O. Box 2440, Eugene, OR 97402; (503) 342-3030.

Please circle 200 on Reader Service Card

Thanks for the memory.

UniDOS Plus allows thousands of DOS 3.3 Apple-soft programs and data files to run with large-capacity 3.5-inch disks. The 3.5-inch disks have five times the storage capacity of floppy disks — but Apple's older DOS 3.3 cannot access them. UniDOS Plus fills this gap. With UniDOS Plus, you get DOS 3.3 compatibility and a big 800K capacity!

More Memory Too!

You get 24% more memory for your programs and data — without hardware! UniDOS moves DOS 3.3 out of program memory and into auxiliary RAM... and adds nearly 9,000 bytes to Applesoft program space. You'll write bigger, more powerful programs that used to be impossible.

Still More!

You get these exciting features too.

- ▶ The first FAST COPY for 3.5-inch disks!
- ▶ Wildcard Catalog commands.
- ▶ Intermixed 3.5- and 5.25-inch disks.
- ▶ Two 400K volumes per disk.
- ▶ Up to two 3.5-inch drives (1.6 megabytes) per slot!

**Order now to get BIG DISK
capacity and BIG MEMORY
in one powerful package!**

System Requirements.

UniDOS Plus runs on any Apple II series computer and is compatible with: Apple UniDisk 3.5, Apple 3.5-inch disk, and the Chinon 800K disk with Central Point's Universal Disk Controller card.

UniDOS Plus works with all Applesoft programs, but doesn't work with many copy-protected or commercial programs.

I want UniDOS Plus! Here's my \$39.95 (C22)

only you can save unprotected software.

Unprotected software is not freeware

Recently, many leading software firms have removed copy protection from their software. They have taken this action for one reason—you, the user, have requested it. You say that unprotected software is less trouble to use, and that it generally simplifies the use of your PC. Many software firms responded and have given you what you requested.

Now the software industry requests something of you. ***Please do not illegally duplicate unprotected software.*** Unprotected software enjoys the same legal protection as protected software. It is not a violation of federal copyright laws to make a back-up copy, but making or distributing additional copies for any other reason is against the law.

Remember, many people worked hard to produce every program you use: designers, programmers, distributors, and retailers, not to mention all the people who support users. They have a right to be compensated for their efforts through legitimate software sales. By removing copy protection from their software, publishers are relying upon your good faith—and your trust. They assume that you want the industry to continue developing even better and more innovative software. Please do not abuse the trust the industry has placed in you.

Do not make unauthorized copies of software.

Only you
can stop
software
piracy.
